Reference attribute grammar controlled rewriting

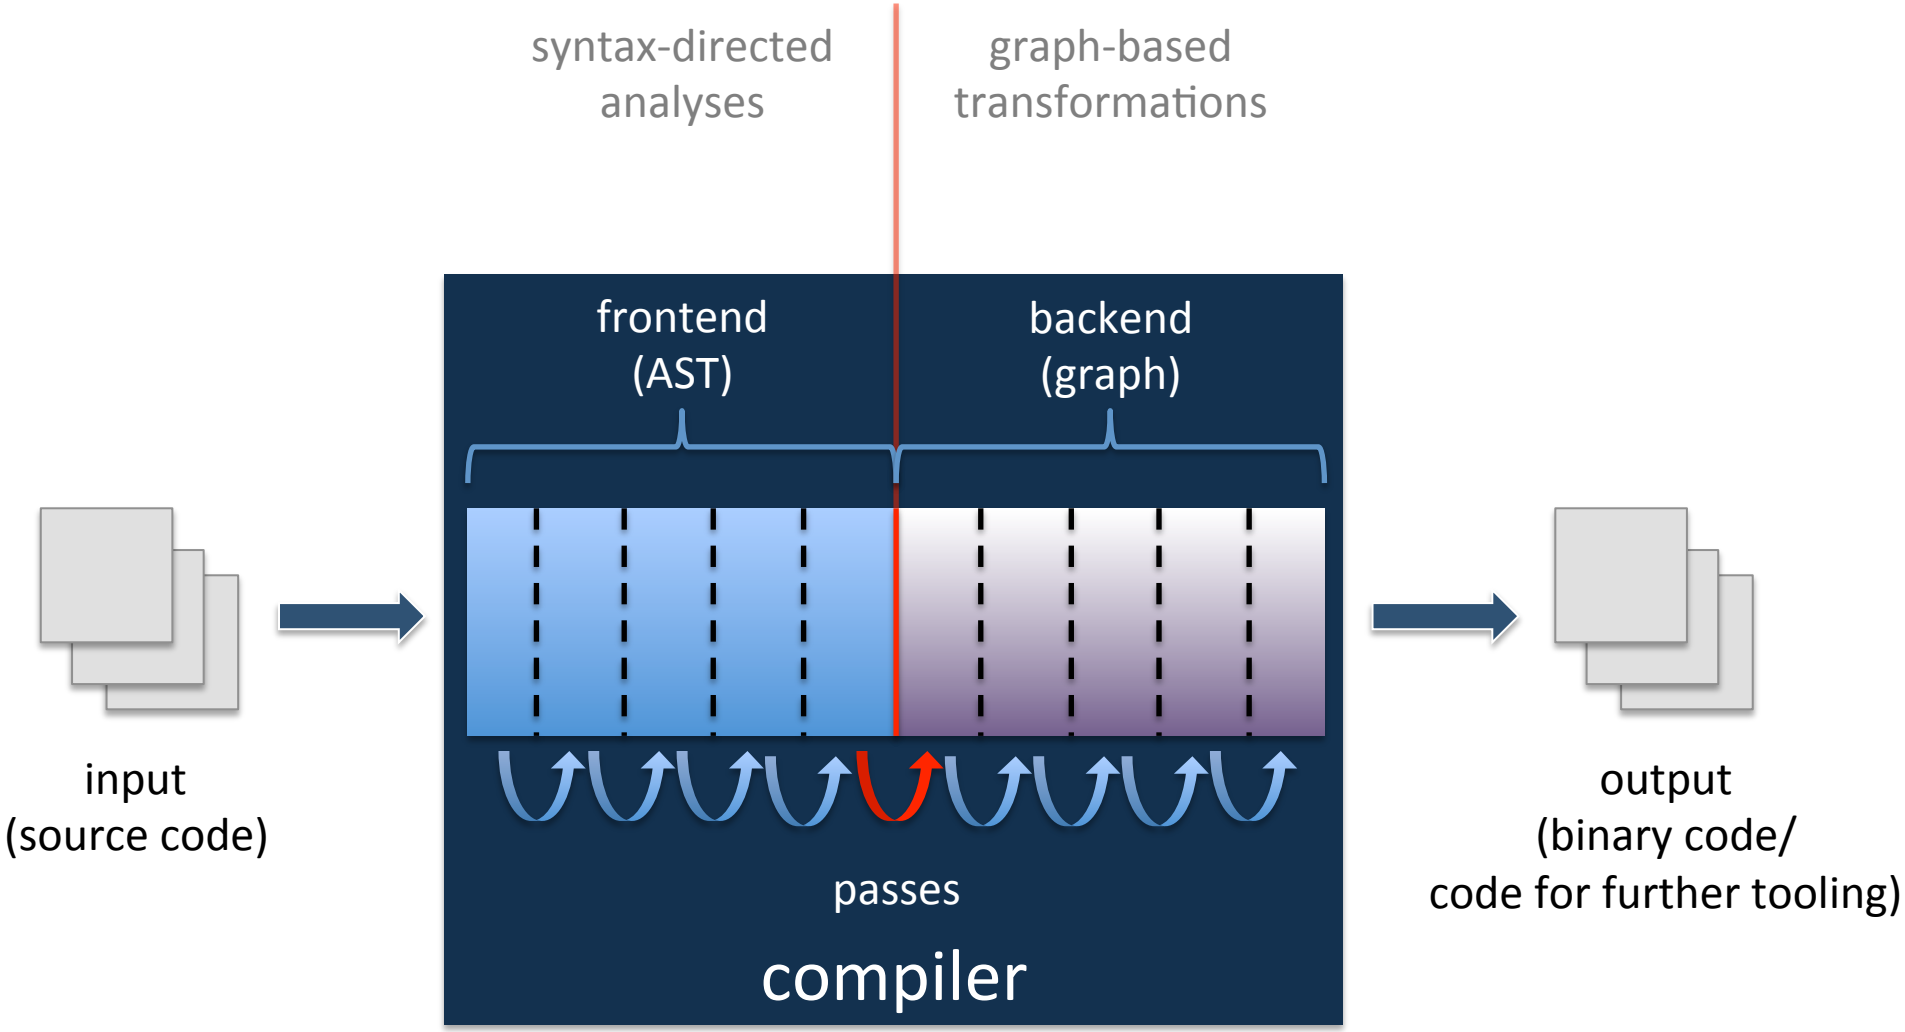
Motivation and overview

Christoff Bürger
Department of Computer Science, Faculty of Engineering, LTH
Lund University
Lund, Sweden
christoff.burger@cs.lth.se

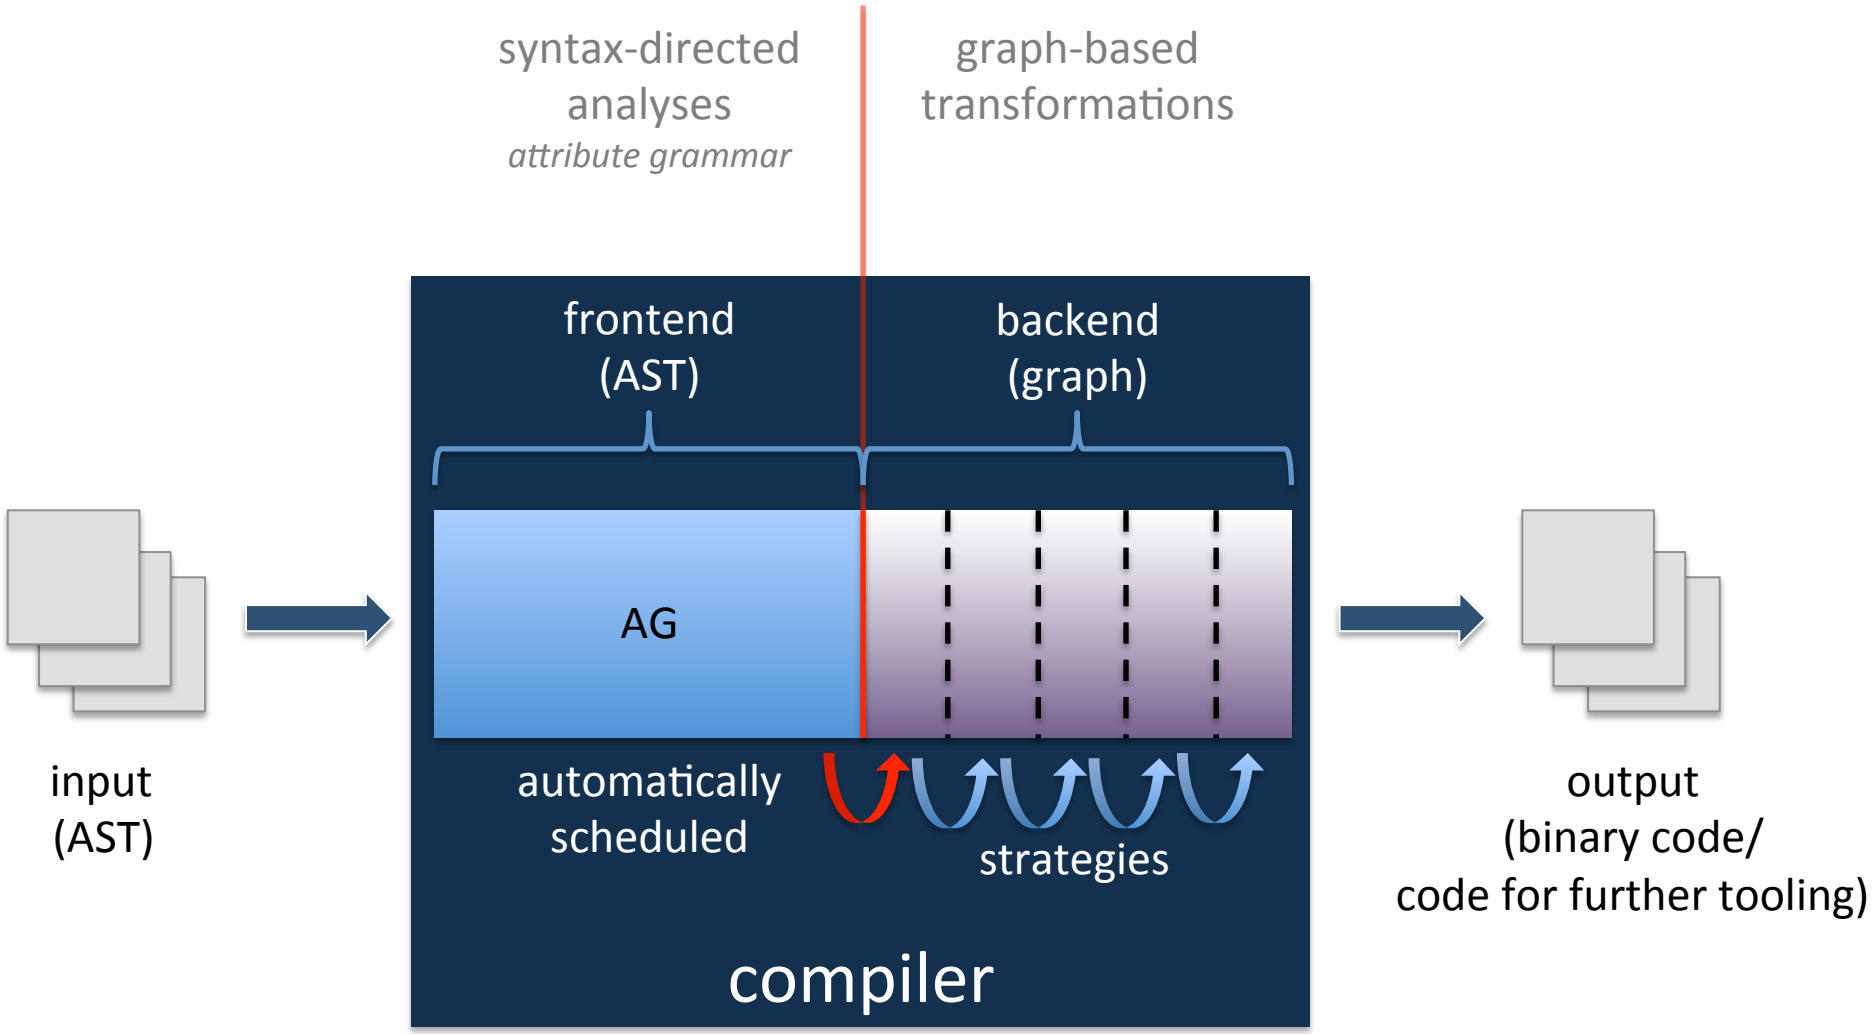
The problem
What do you want?

Interactive, mutual-dependent analyses
& transformations

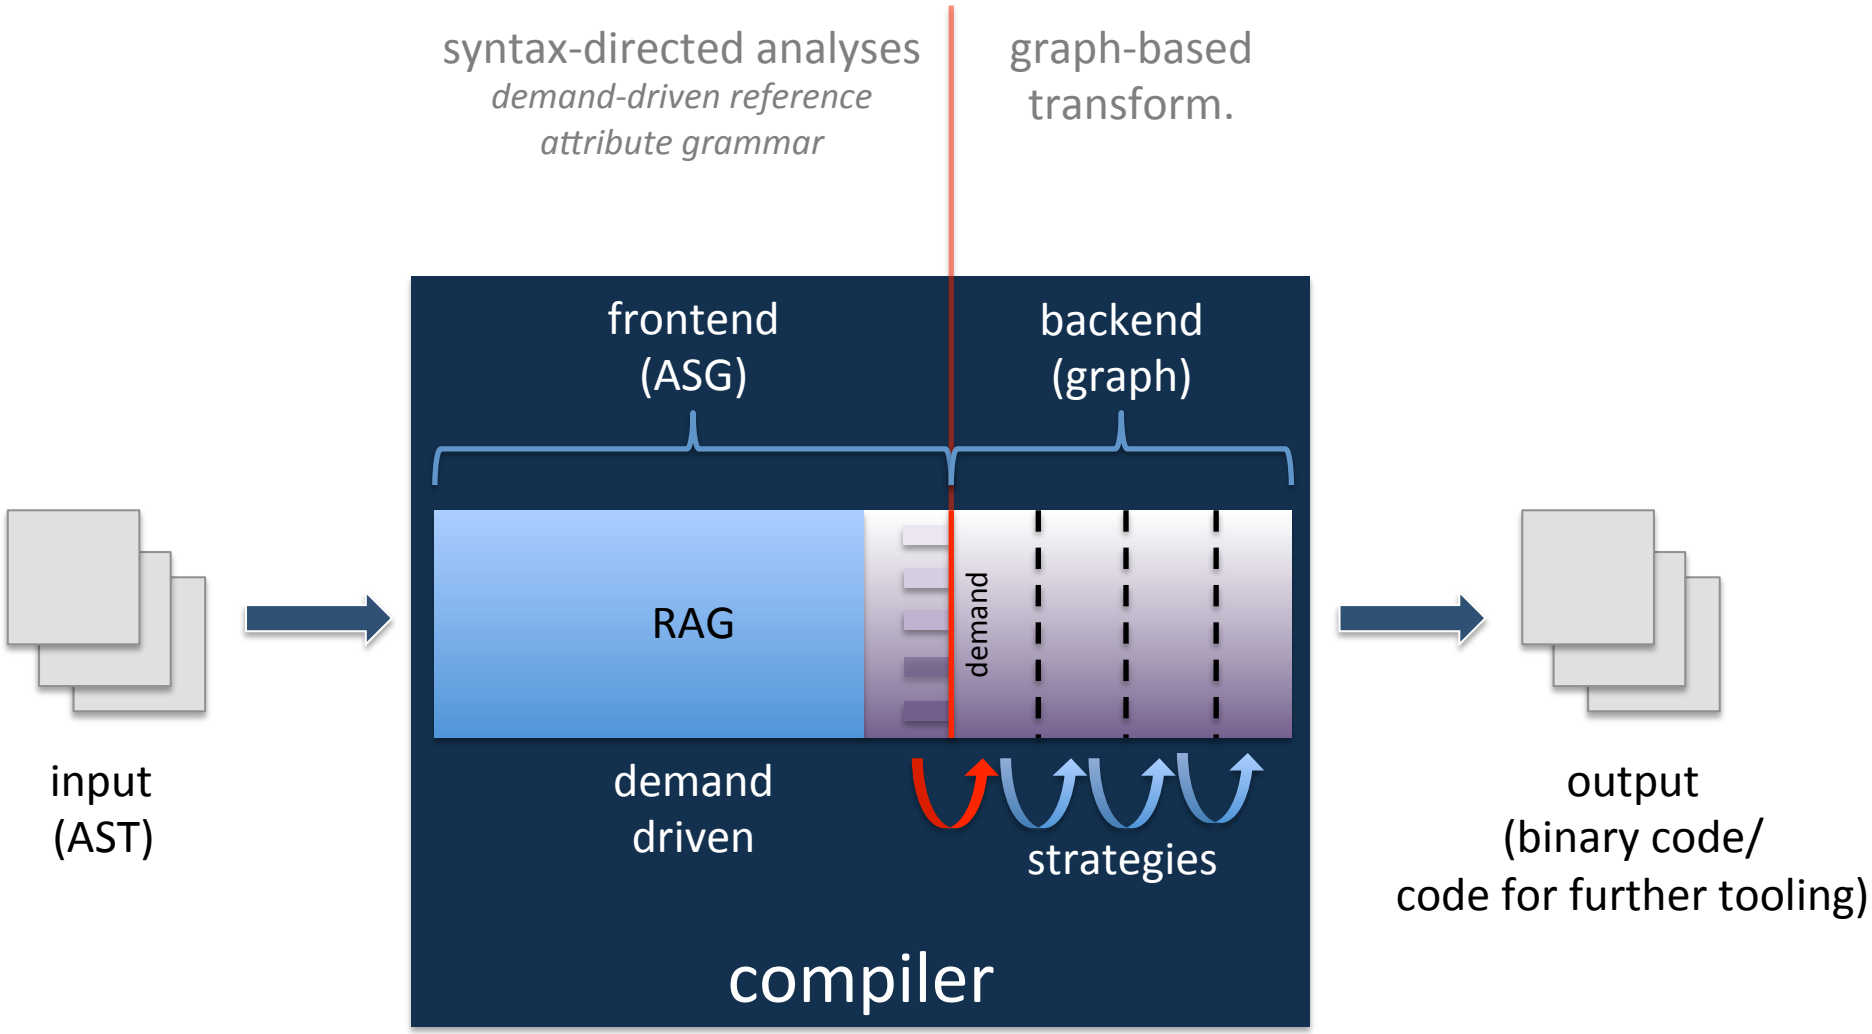
From batch to interactive



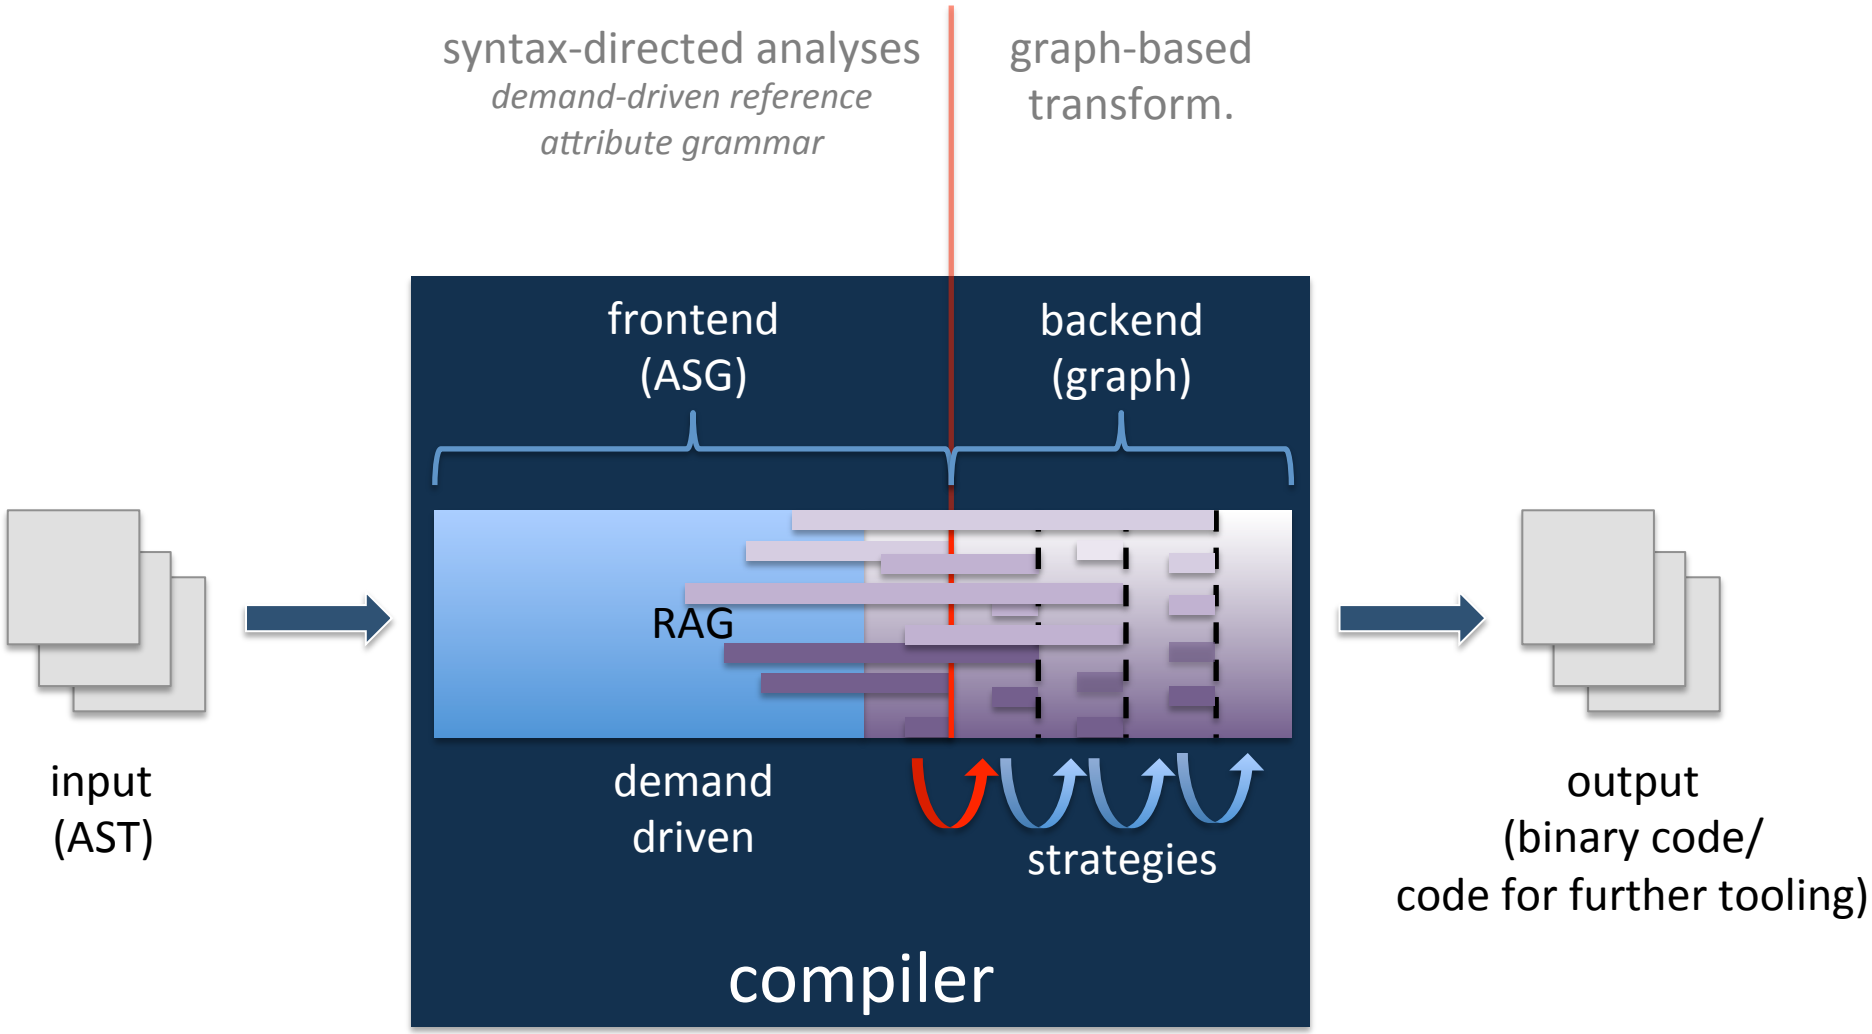
From batch to interactive



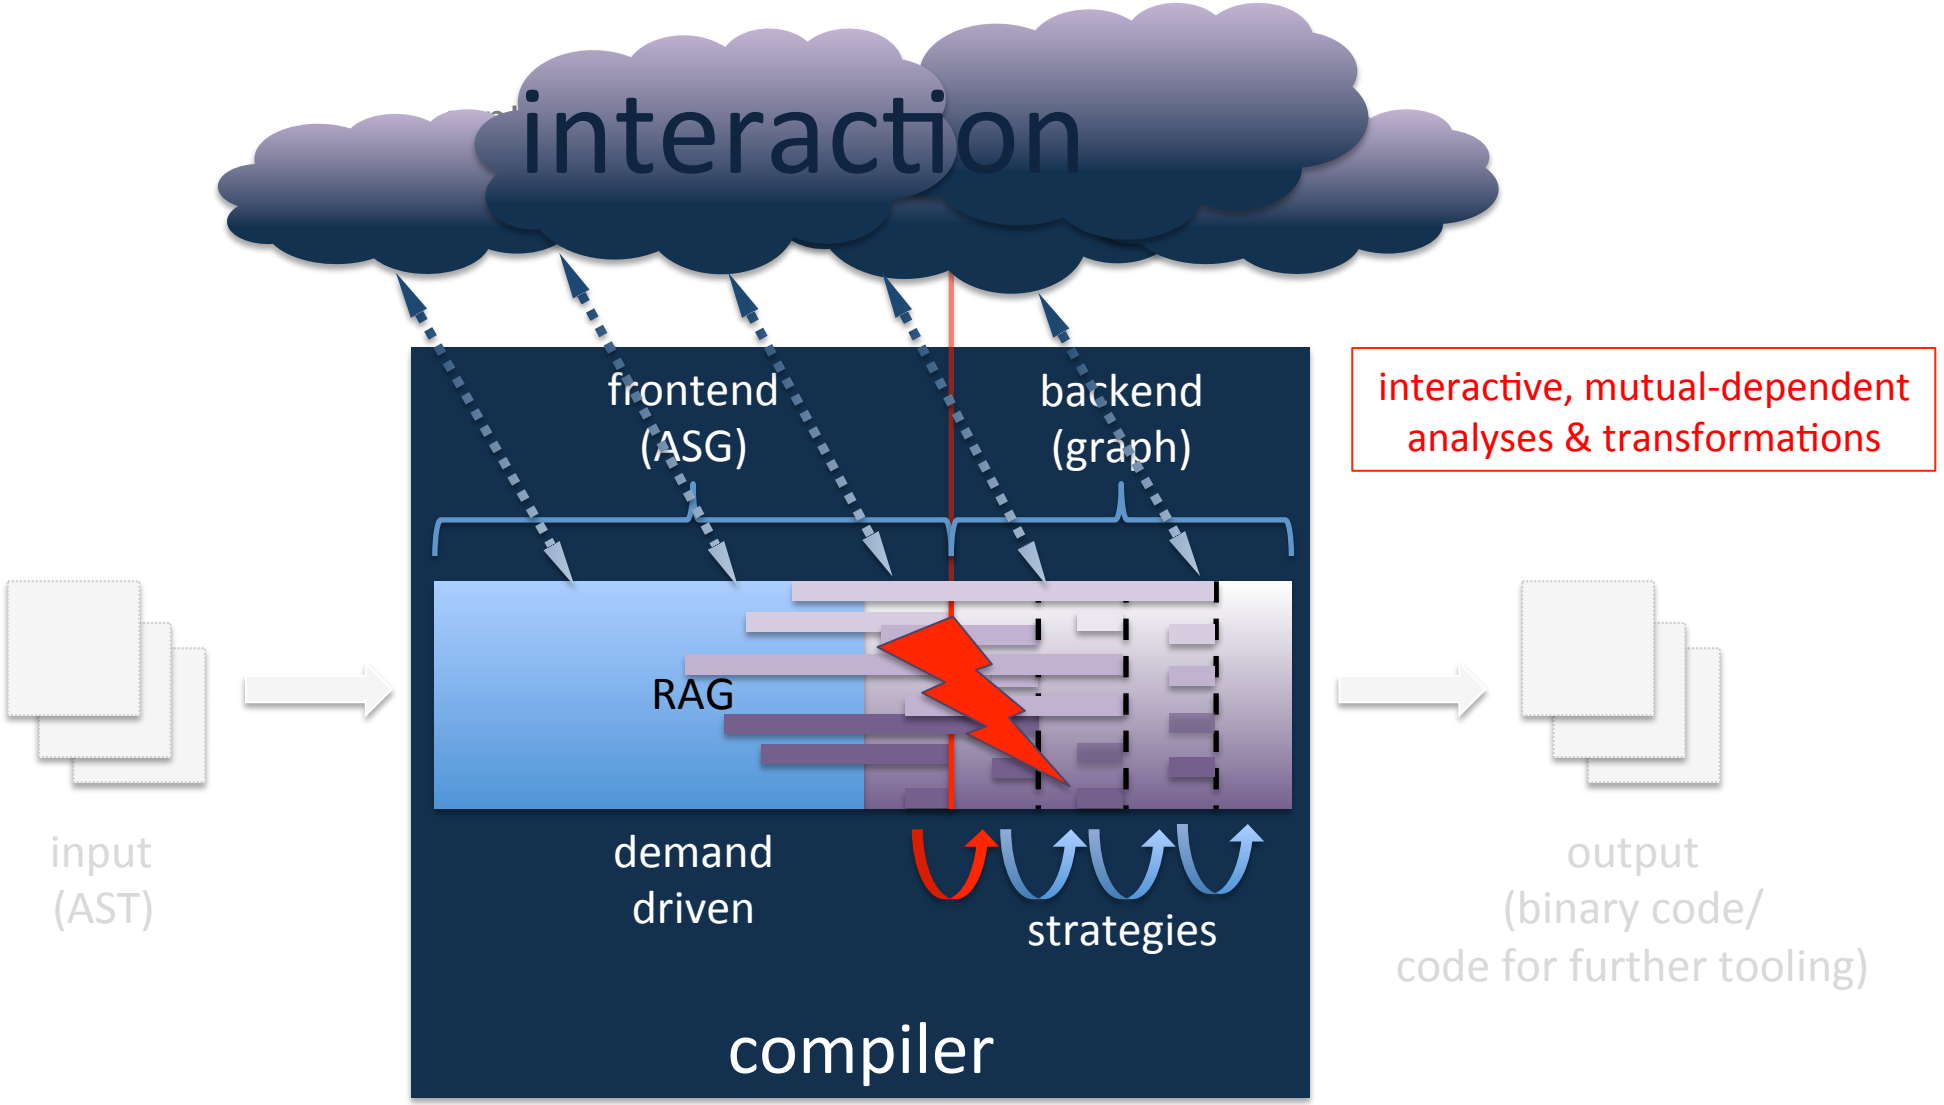
From batch to interactive



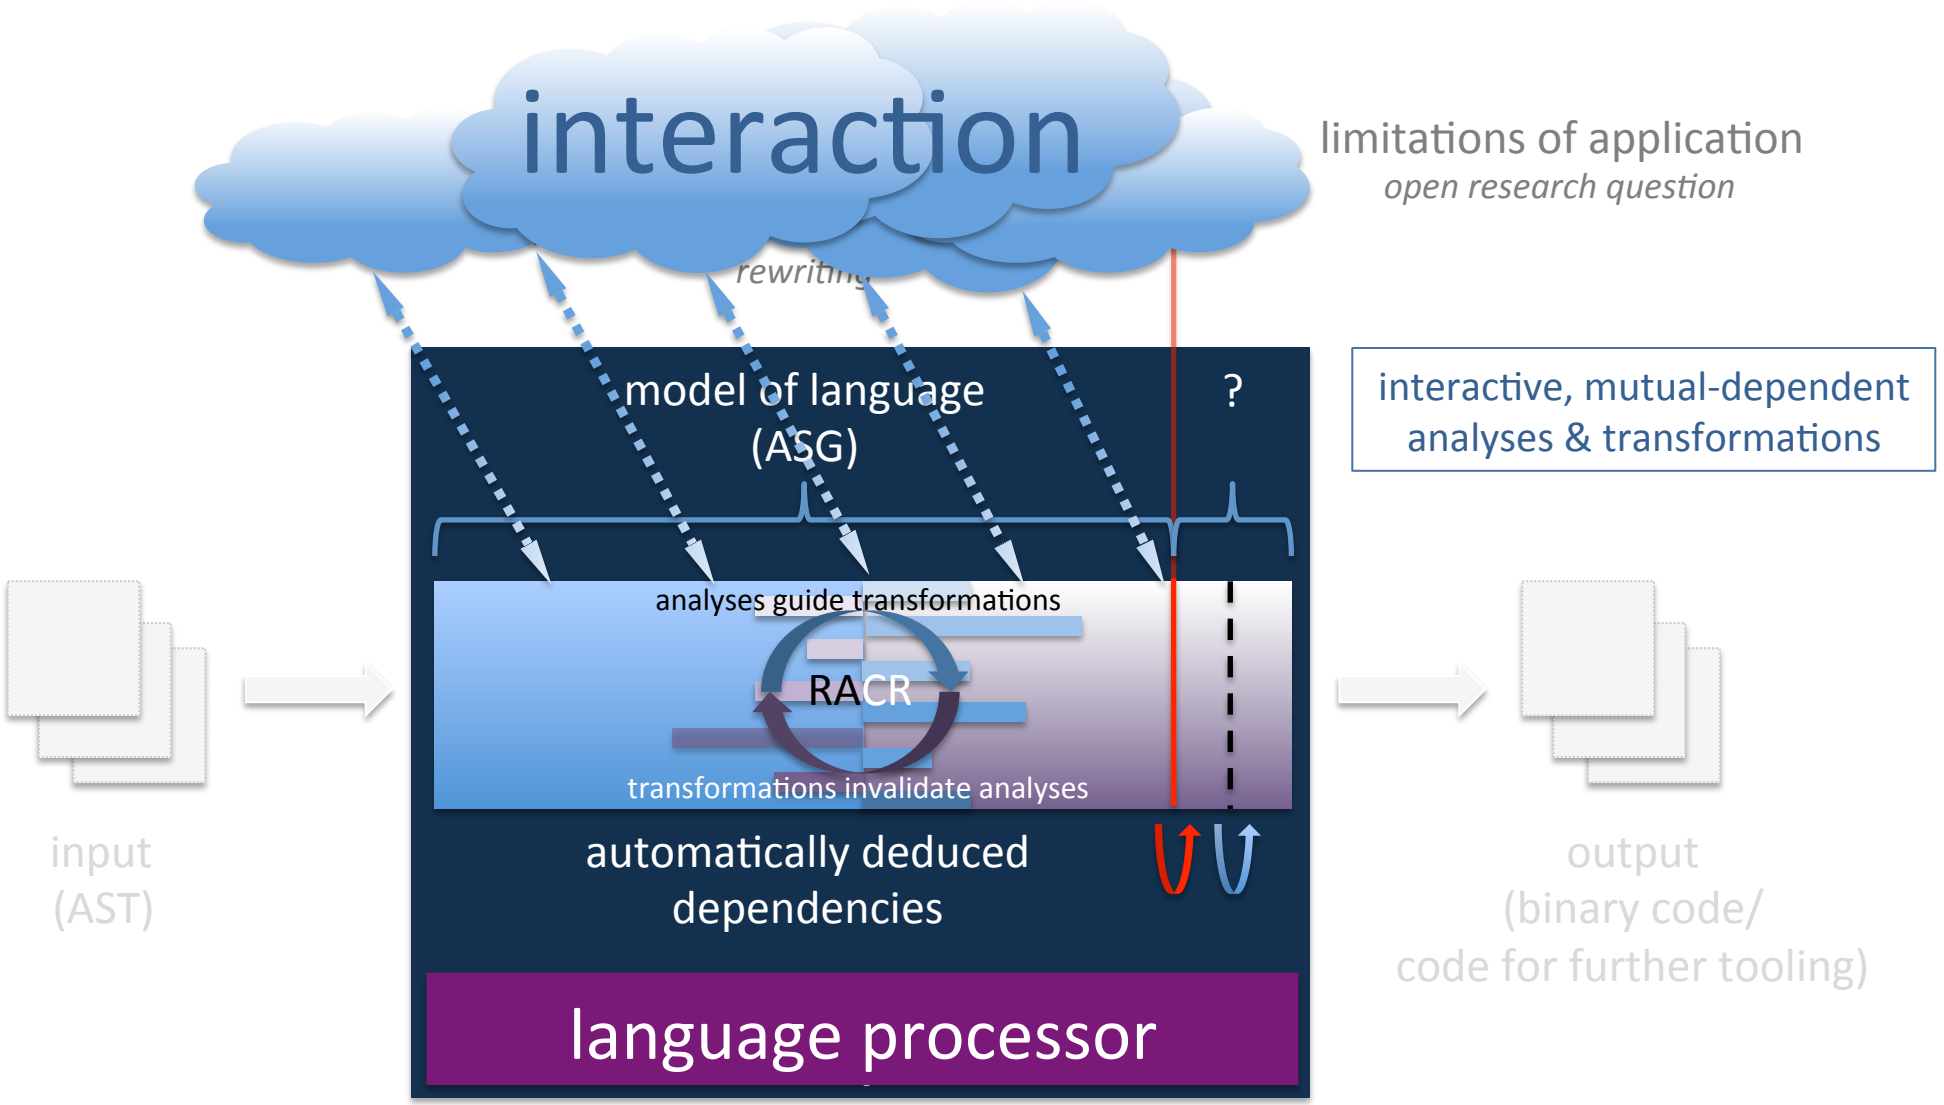
From batch to interactive



From batch to interactive



From batch to interactive



The solution
What is RAG-controlled rewriting?

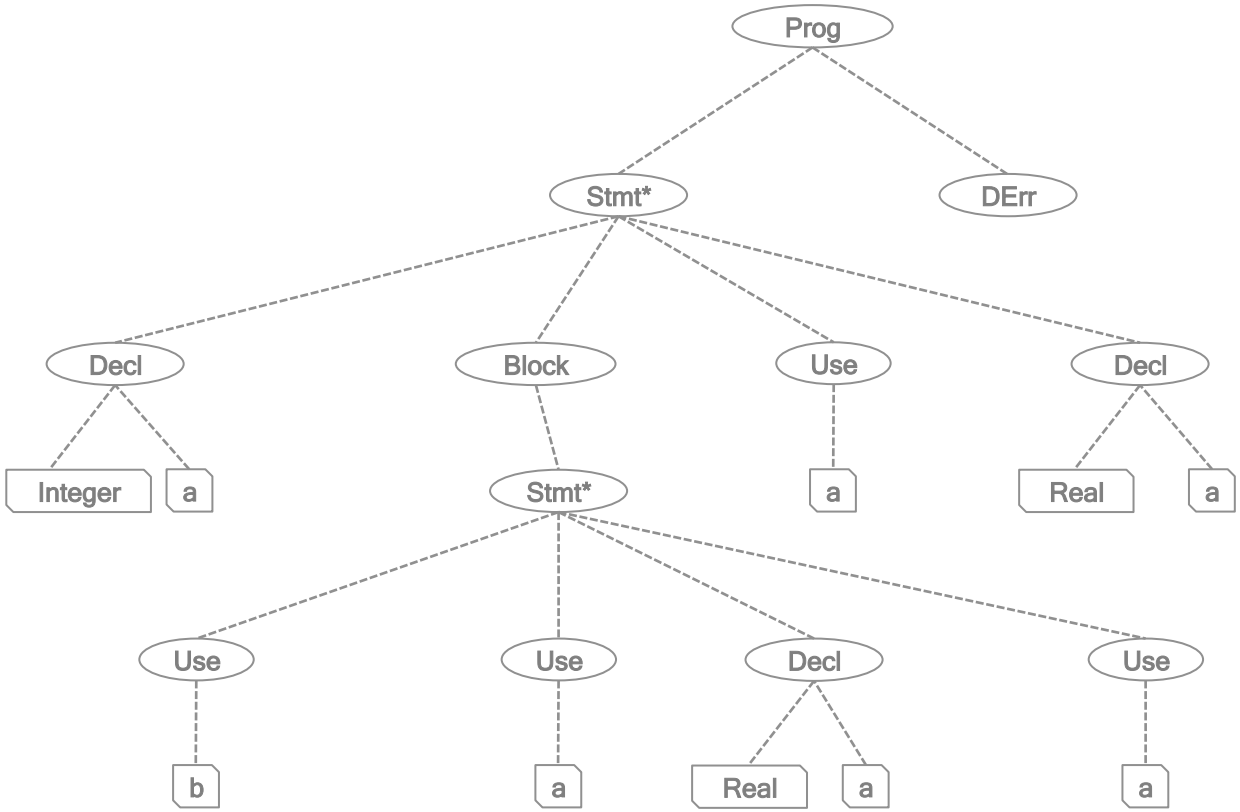
Reference attribute grammars, ASGs,
RAG-controlled rewriting & *RACR*[1]

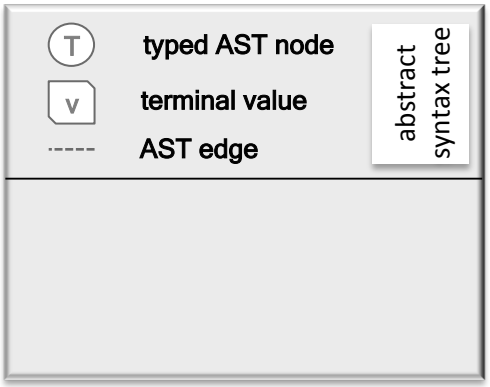
[1] https://github.com/christoff-buerger/racr

Reference attribute grammars & ASGs

```
Program
        decl a : integer
        Begin
                use b ; Error
                use a
                decl a : real
                use a
        End
        use a
        decl a : real ; Error
End
```

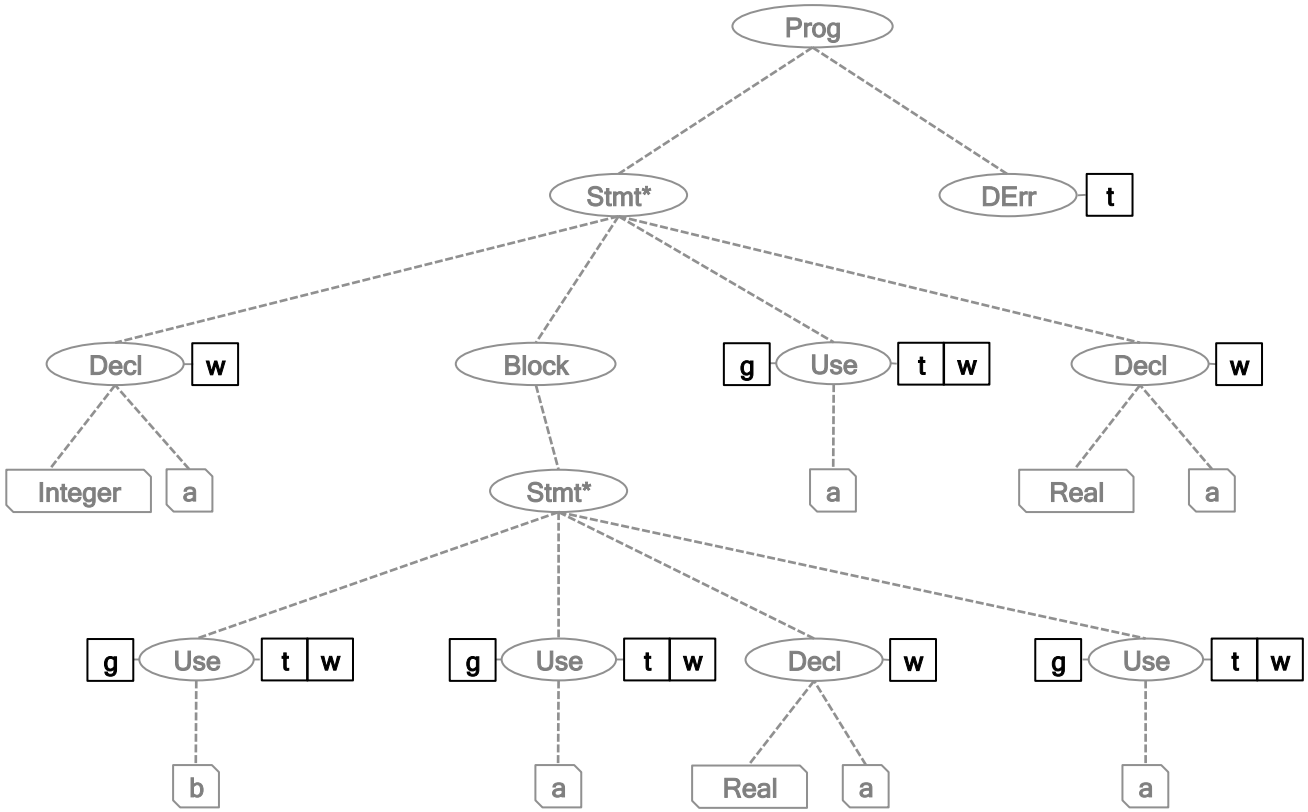
Reference attribute grammars & ASGs

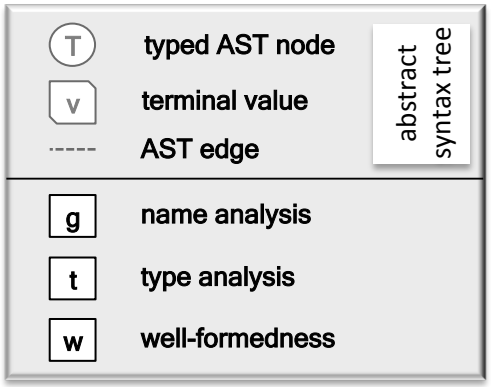




```
Program
        decl a : integer
        Begin
                use b ; Error
                use a
                decl a : real
                use a
        End
        use a
        decl a : real ; Error
End
```

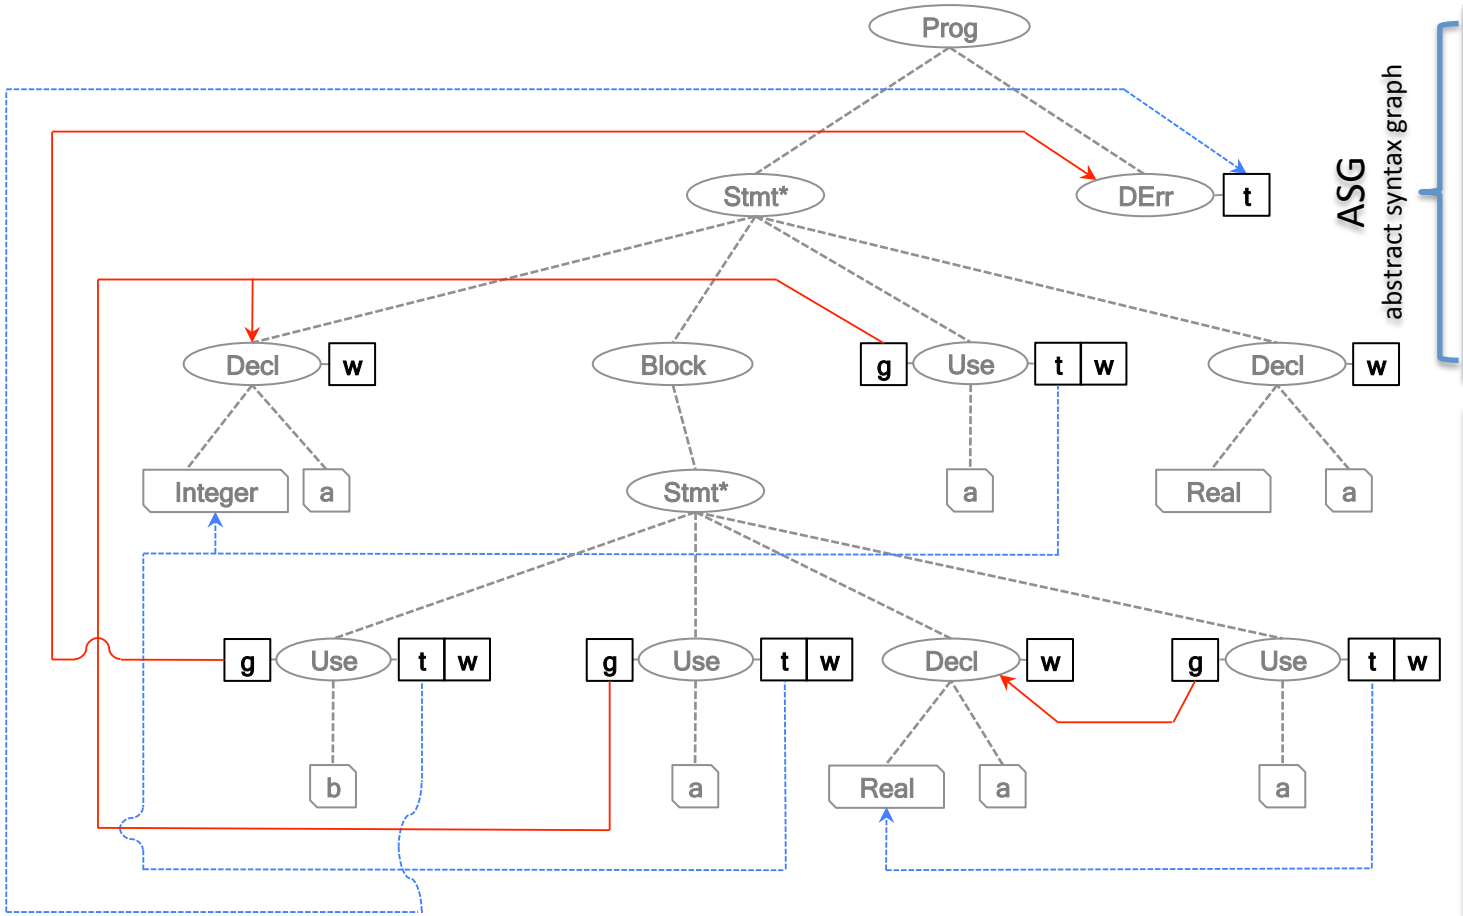
Reference attribute grammars & ASGs

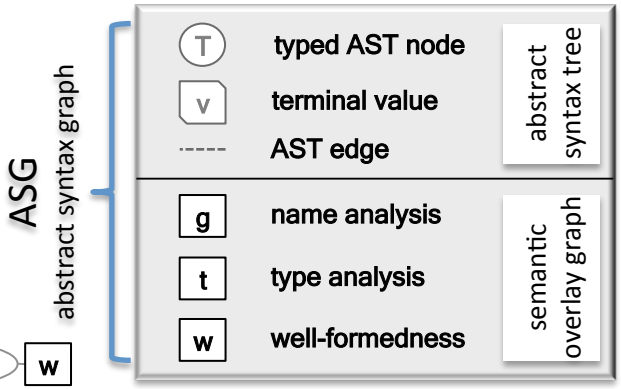




```
Program
        decl a : integer
        Begin
                use b ; Error
                use a
                decl a : real
                use a
        End
        use a
        decl a : real ; Error
End
```

Reference attribute grammars & ASGs





```
Program
        decl a : integer
        Begin
                use b ; Error
                use a
                decl a : real
                use a
        End
        use a
        decl a : real ; Error
End
```

RAG-controlled rewriting

- RAG-controlled rewriting = RAGs + rewriting
  - RAG for declarative analyses
  - graph rewriting for ASG transformations
  - seamless combination:
    - use of analyses to deduce rewrites
    - rewrites automatically update analyses

    >> incremental

} mutual control

RACR

Reference implementation of RAG-controlled rewriting in *Scheme.*

https://github.com/christoff-buerger/racr

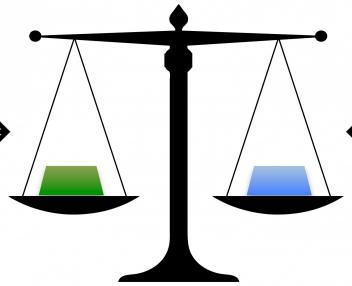
The implementation
How works RAG-controlled rewriting?

Dynamic attribute dependency graphs &
incremental evaluation

Query & rewrite functions

well balanced set of functions

query functions to access ASG
add dependencies on queried information →

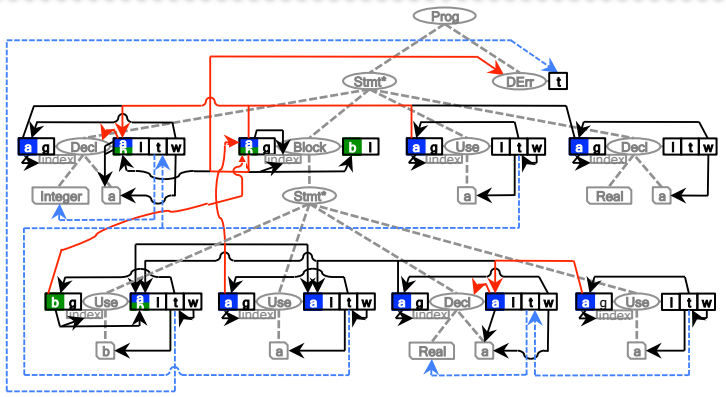


← rewrite functions to change ASG
invalidate attributes depending on rewritten information

query functions

- only way to query ASG
- used in attribute equations

construct



dynamic attribute dependency graph

rewrite functions

- only way to change ASG
- used for transformations

invalidate

demand-driven evaluation avoids unnecessary computations

Query & rewrite functions

query functions

(=Name n . a)	value of attribute *Name*
(->c n)	child *c* of *n* (c can be index)
(<- n)	parent of *n*
(->c? n)	has *n* a *c* child (*c* can be index)
(<-? n)	has *n* a parent
(index n)	child-position of *n*
(num-children n)	number of children of *n*
(T=? n)	is *n* exactly of type *T*
(T<? n)	is *n* subtype of type *T*
(T>? n)	is *n* supertype of type *T*
({=,<,>}? n1 n2)	is *n1 {=,<,>}*-type of *n2*
(find f n . b)	find child of *n* satisfying *f*

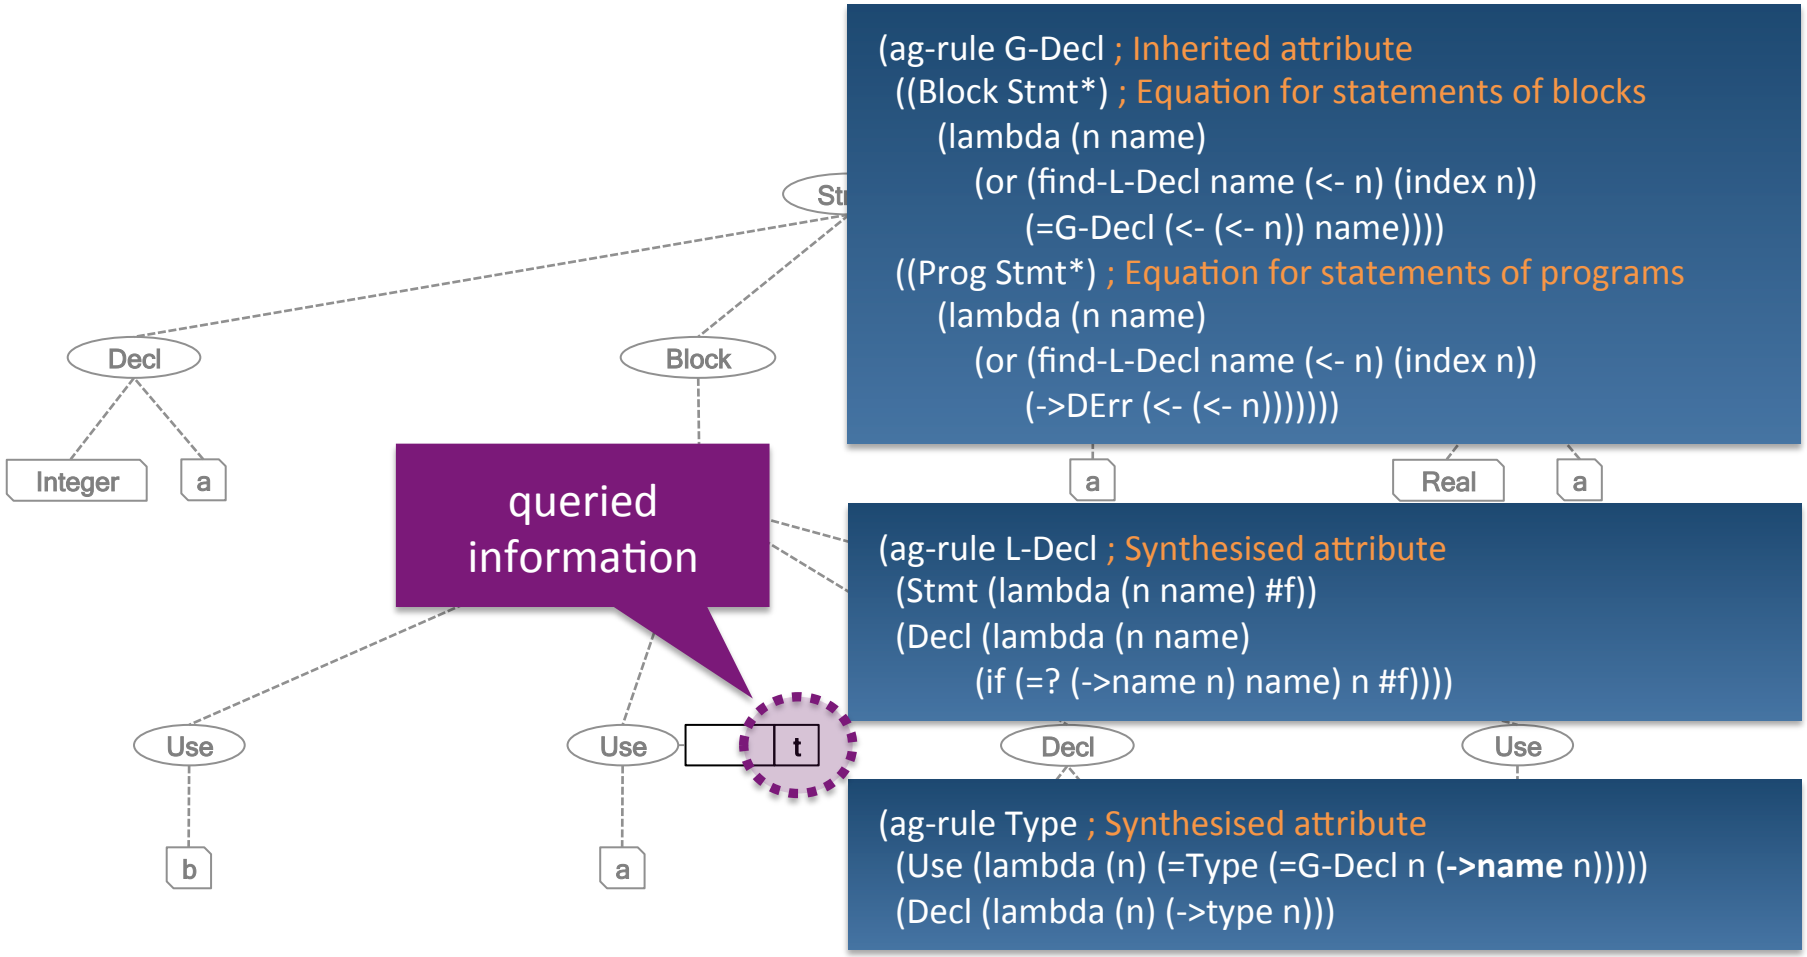
rewrite functions

(r-subtree n1 n2)	replace *n1* by *n2*
(r-terminal t v)	replace value of terminal *t*
(add n l)	add *n* to list *l*
(insert n i l)	insert *n* at position *i* in *l*
(delete n)	delete list element *n*
(refine n T . c)	refine *n* to subtype *T*
(abstract n T)	abstract *n* to supertype *T*

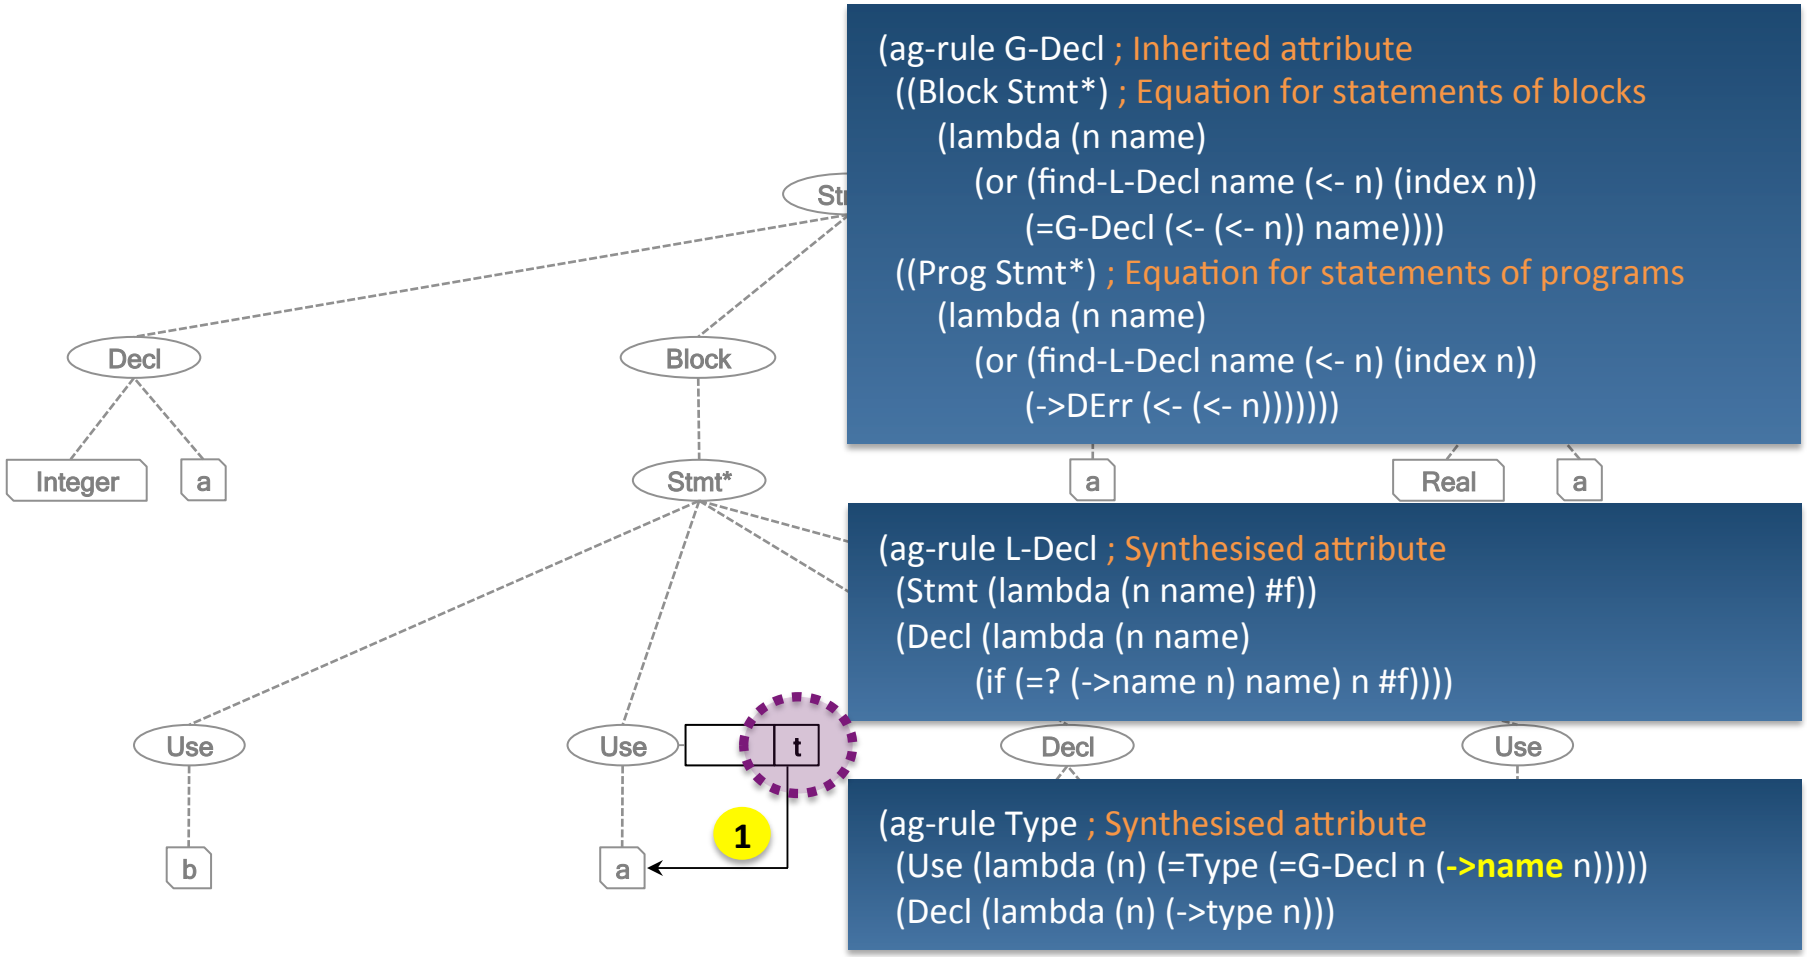
dependency types

value, exists, has-child(*child*/*index*), has-parent, index, num-children, type, subtype(*T*), supertype(*T*)

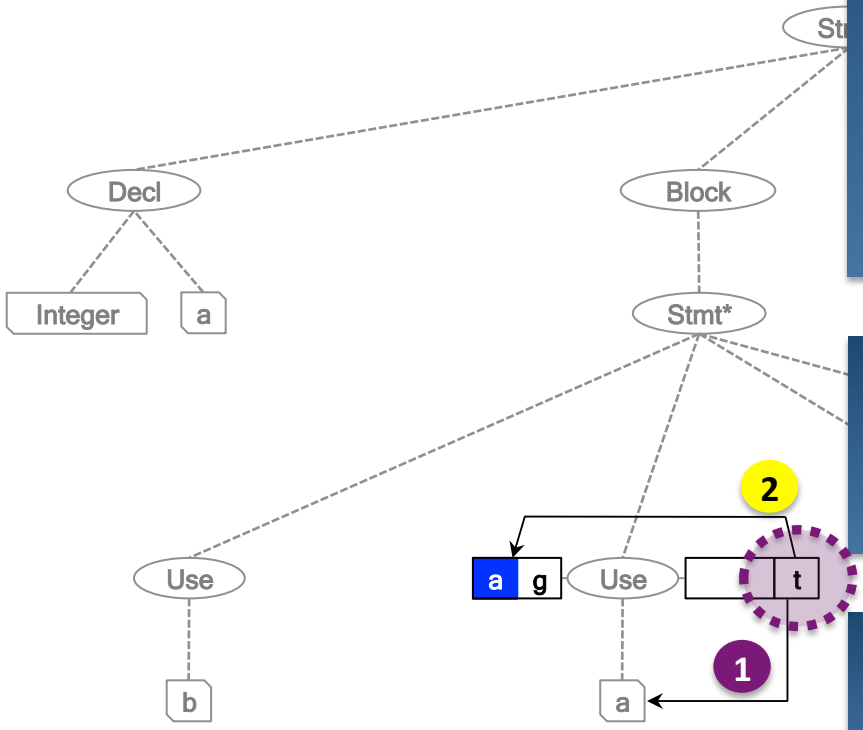
Dynamic attribute dependency graphs



Dynamic attribute dependency graphs



Dynamic attribute dependency graphs



```
(ag-rule G-Decl ; Inherited attribute

Dynamic attribute dependency graphs

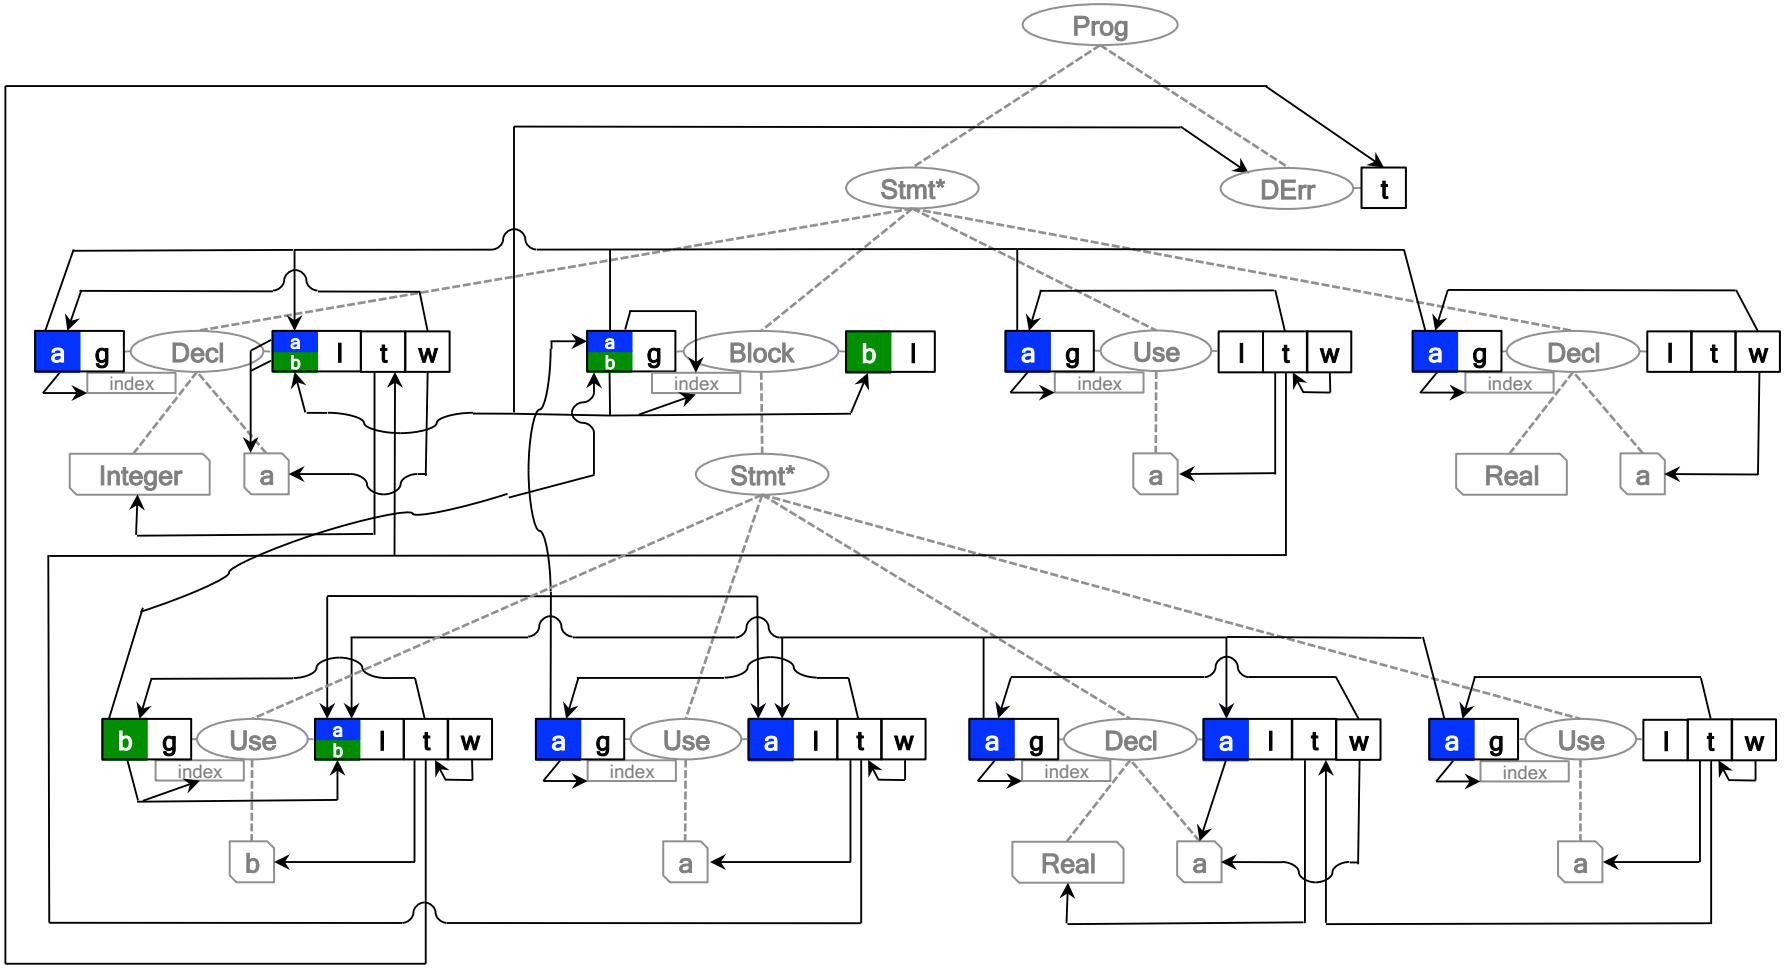
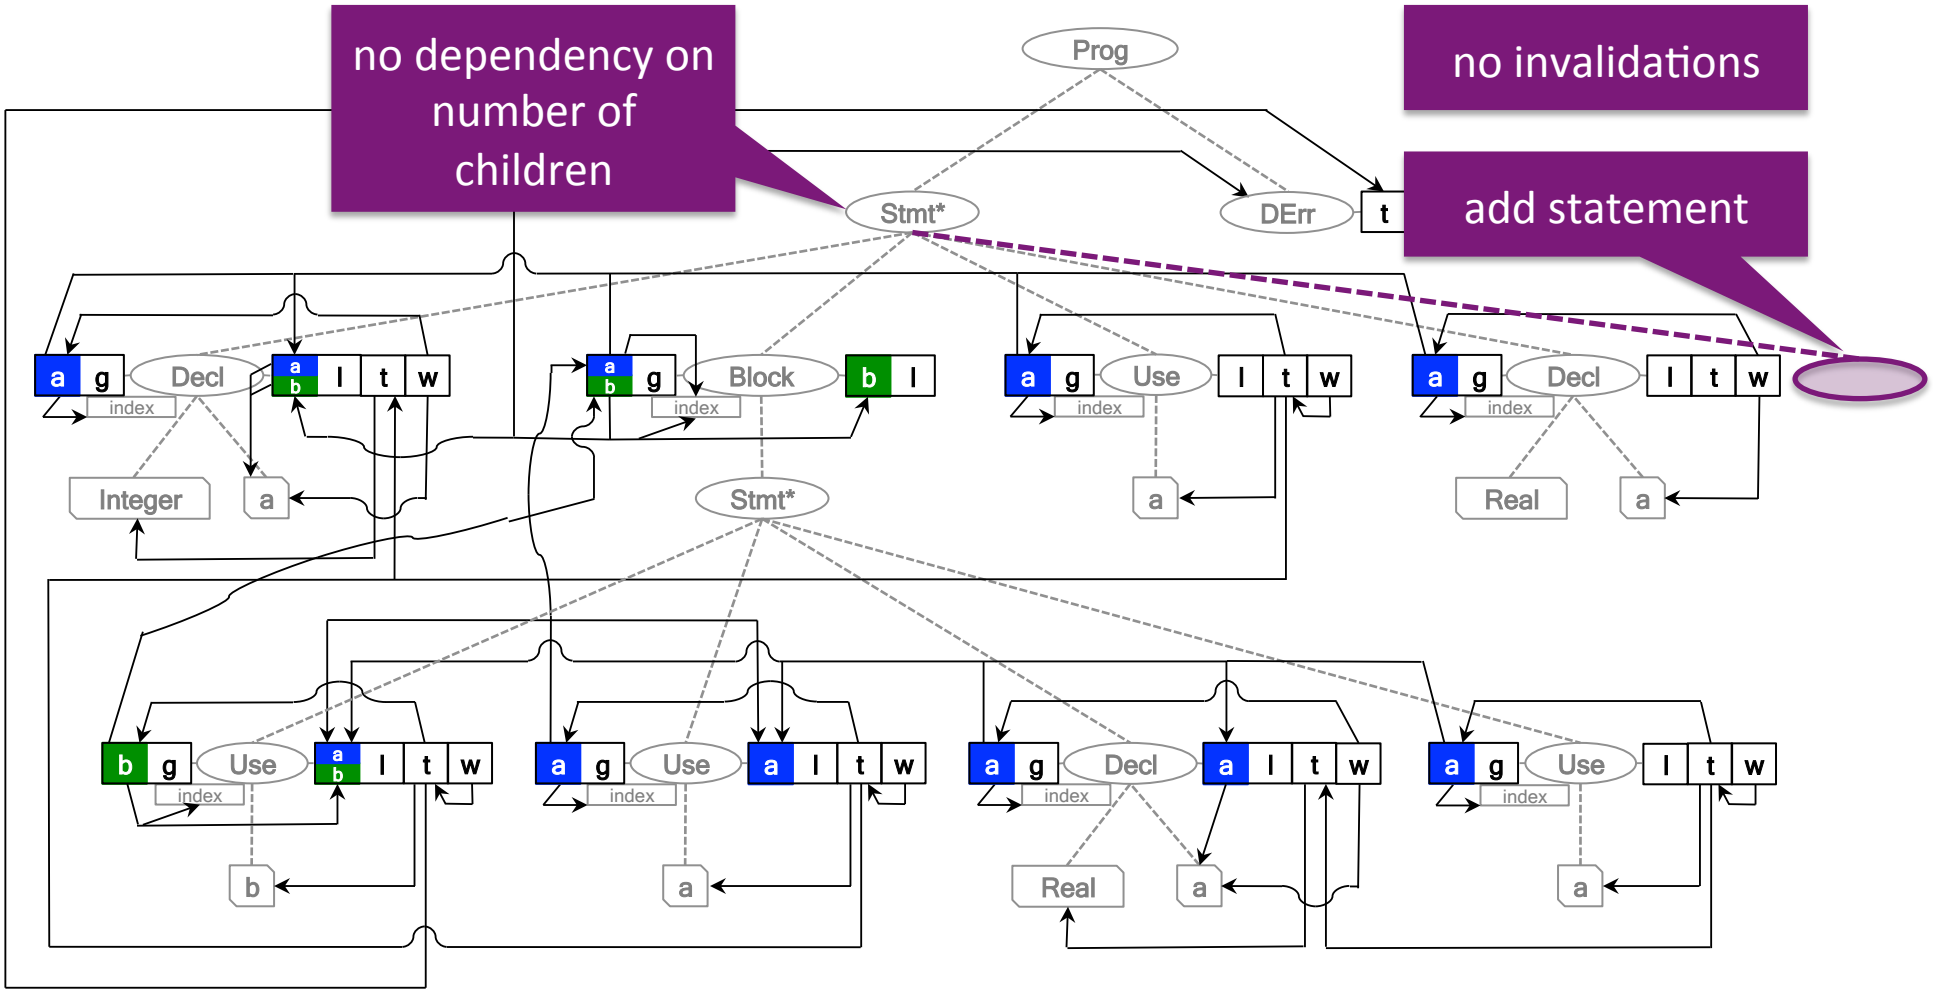
complex to achieve manually

Dynamic attribute dependency graphs

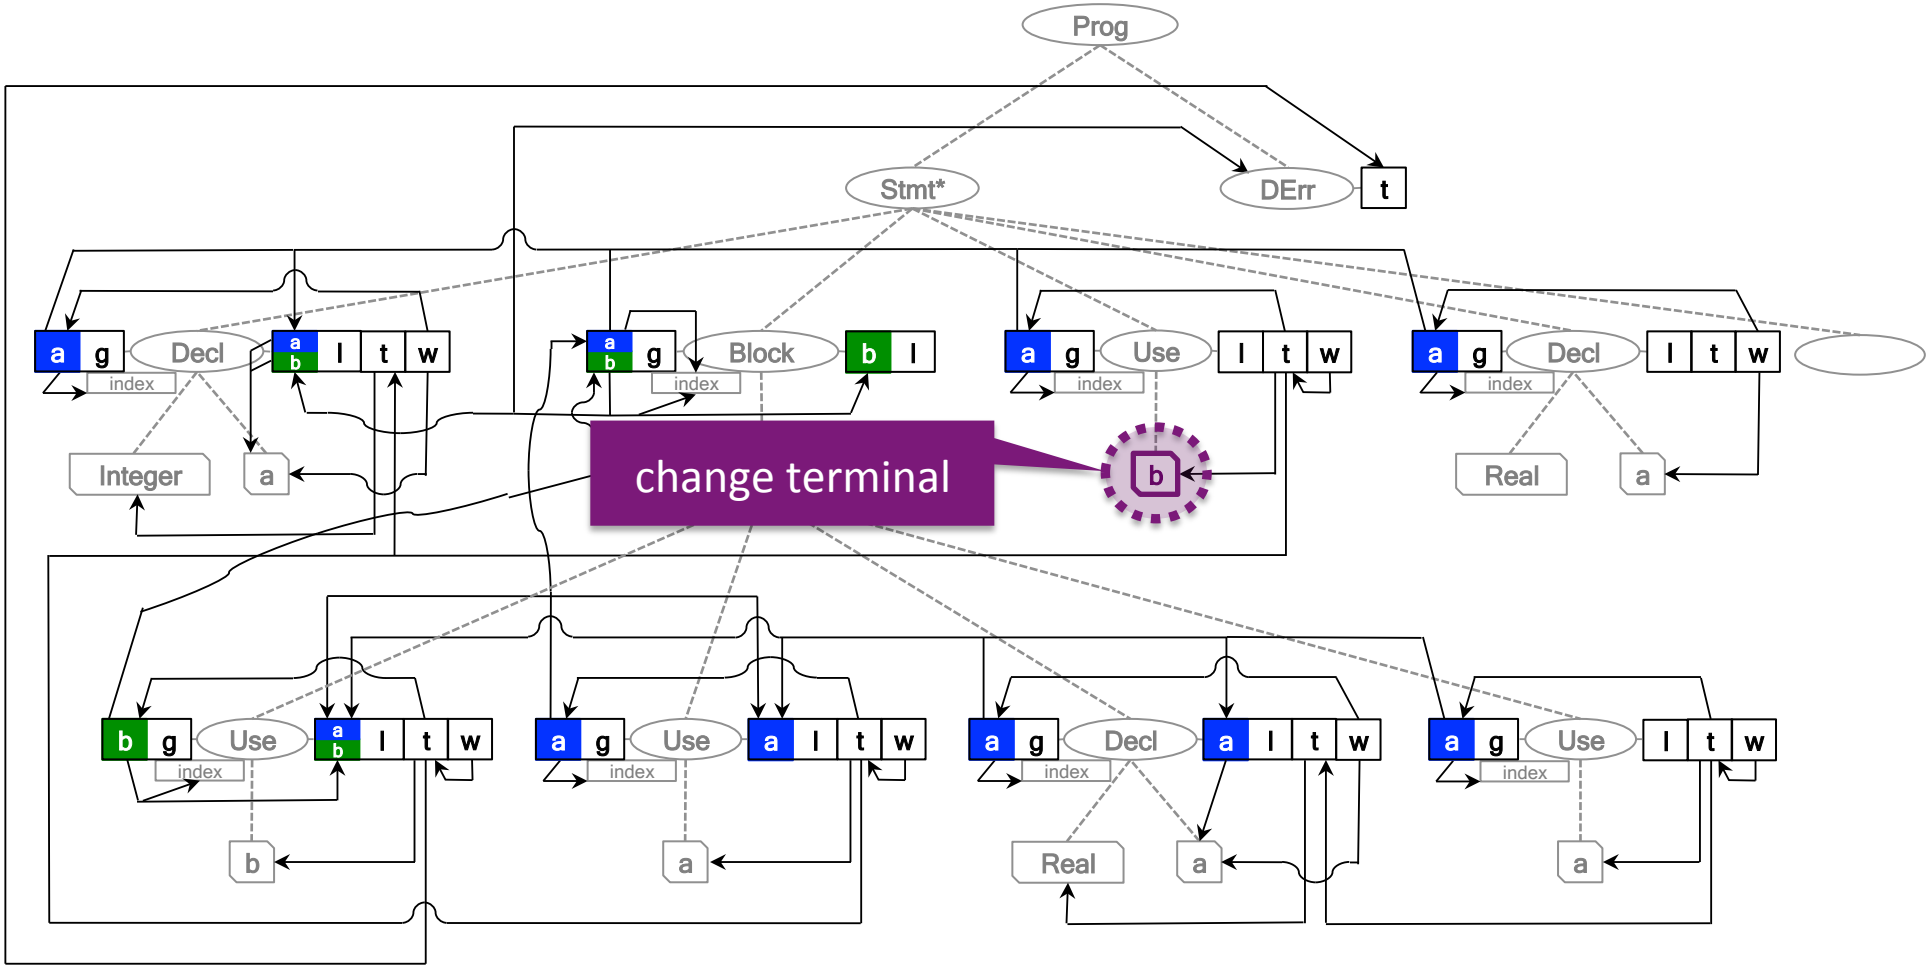


automatically in RAG-controlled rewriting

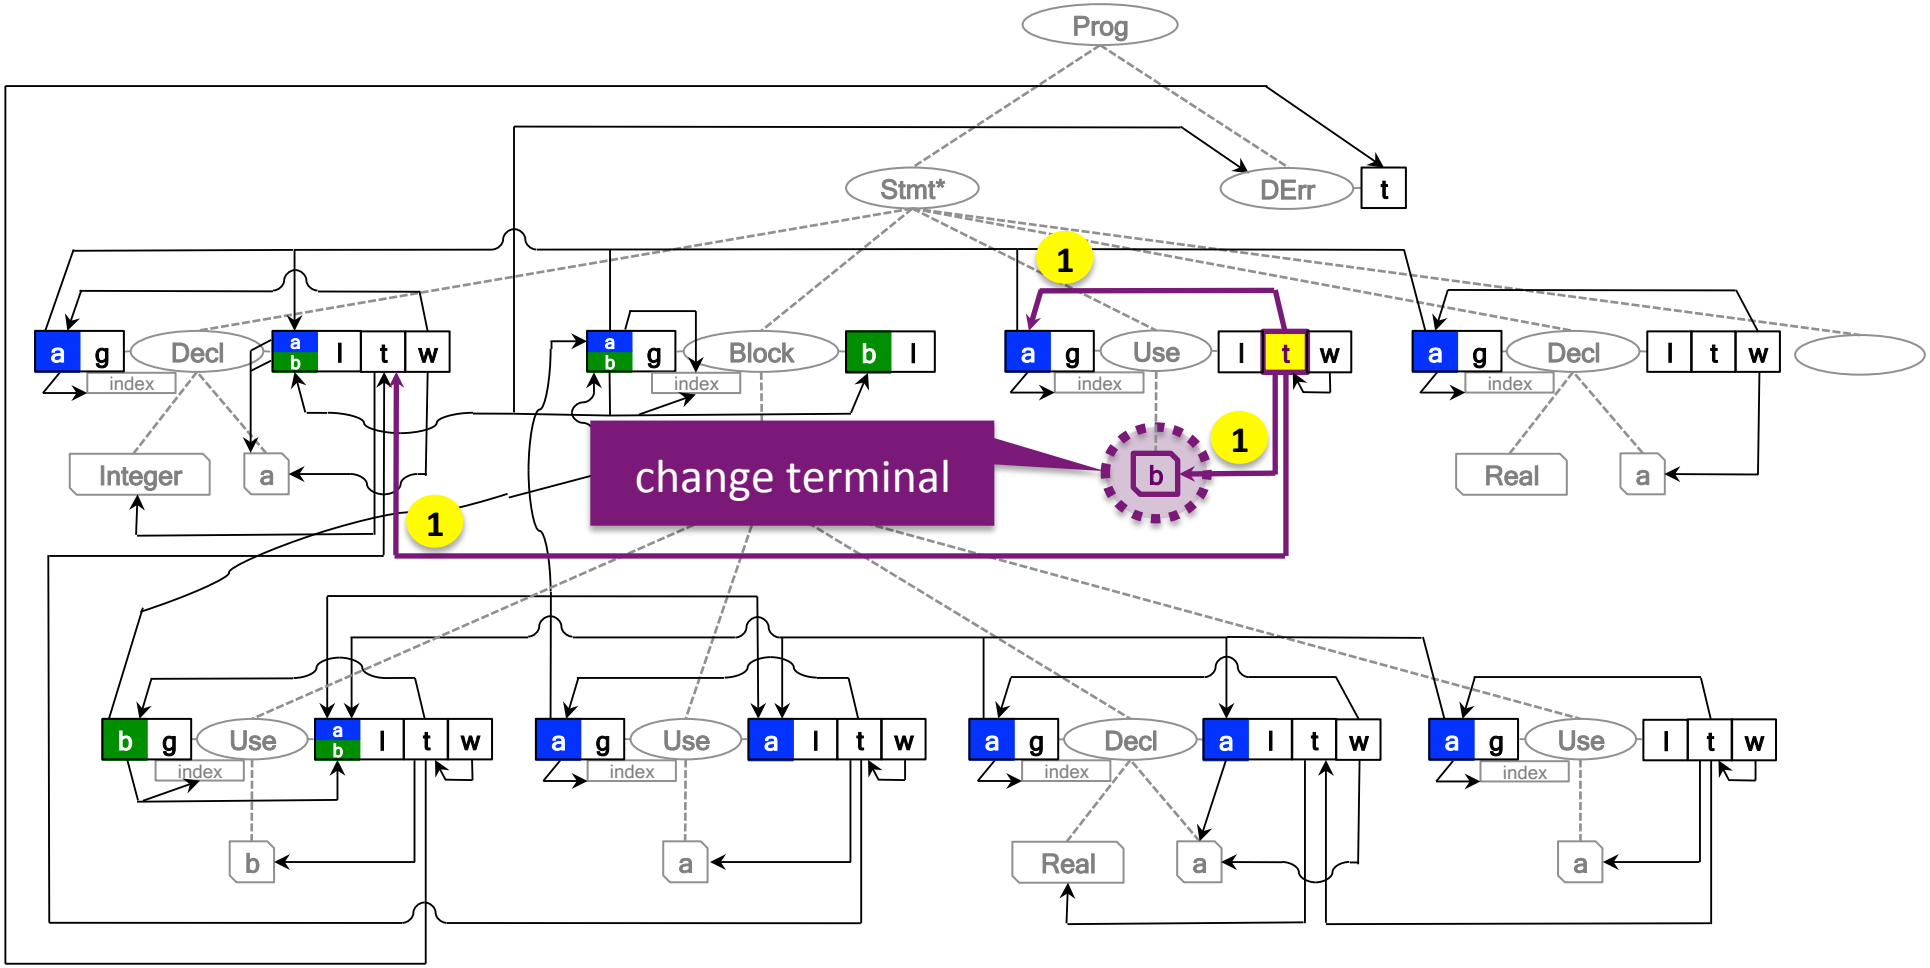
Incremental evaluation



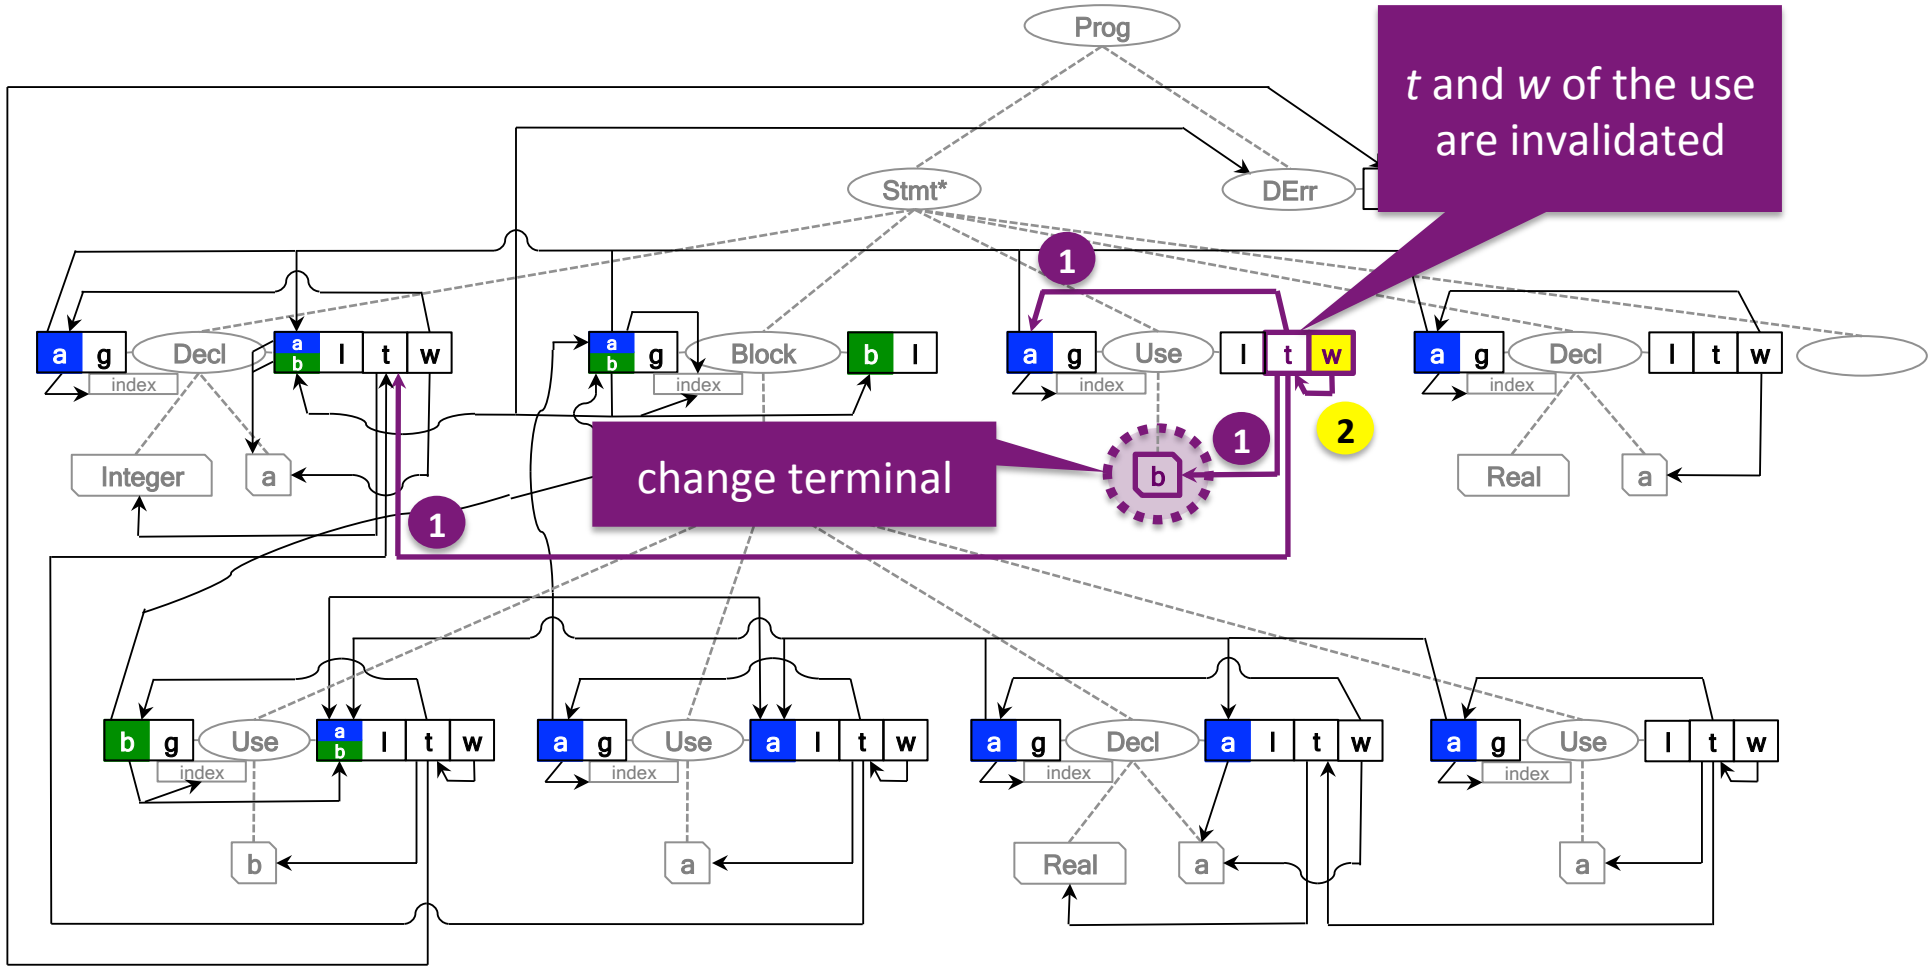
Incremental evaluation



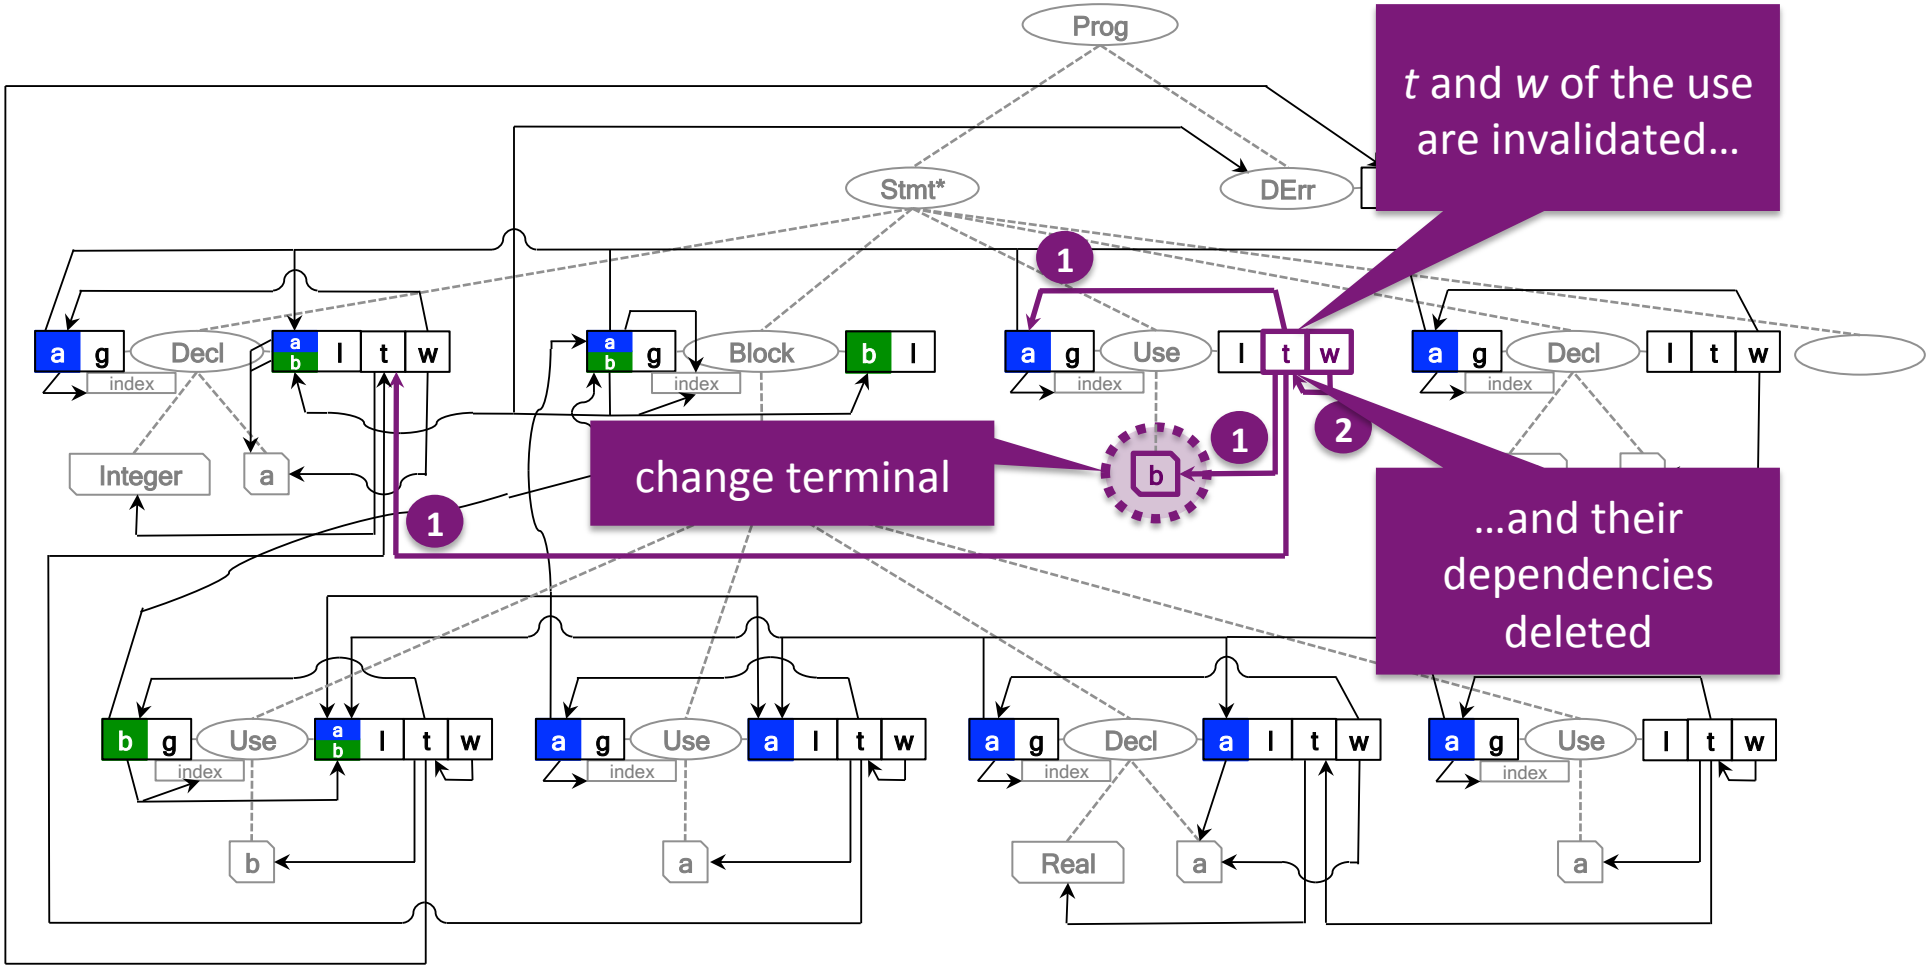
Incremental evaluation



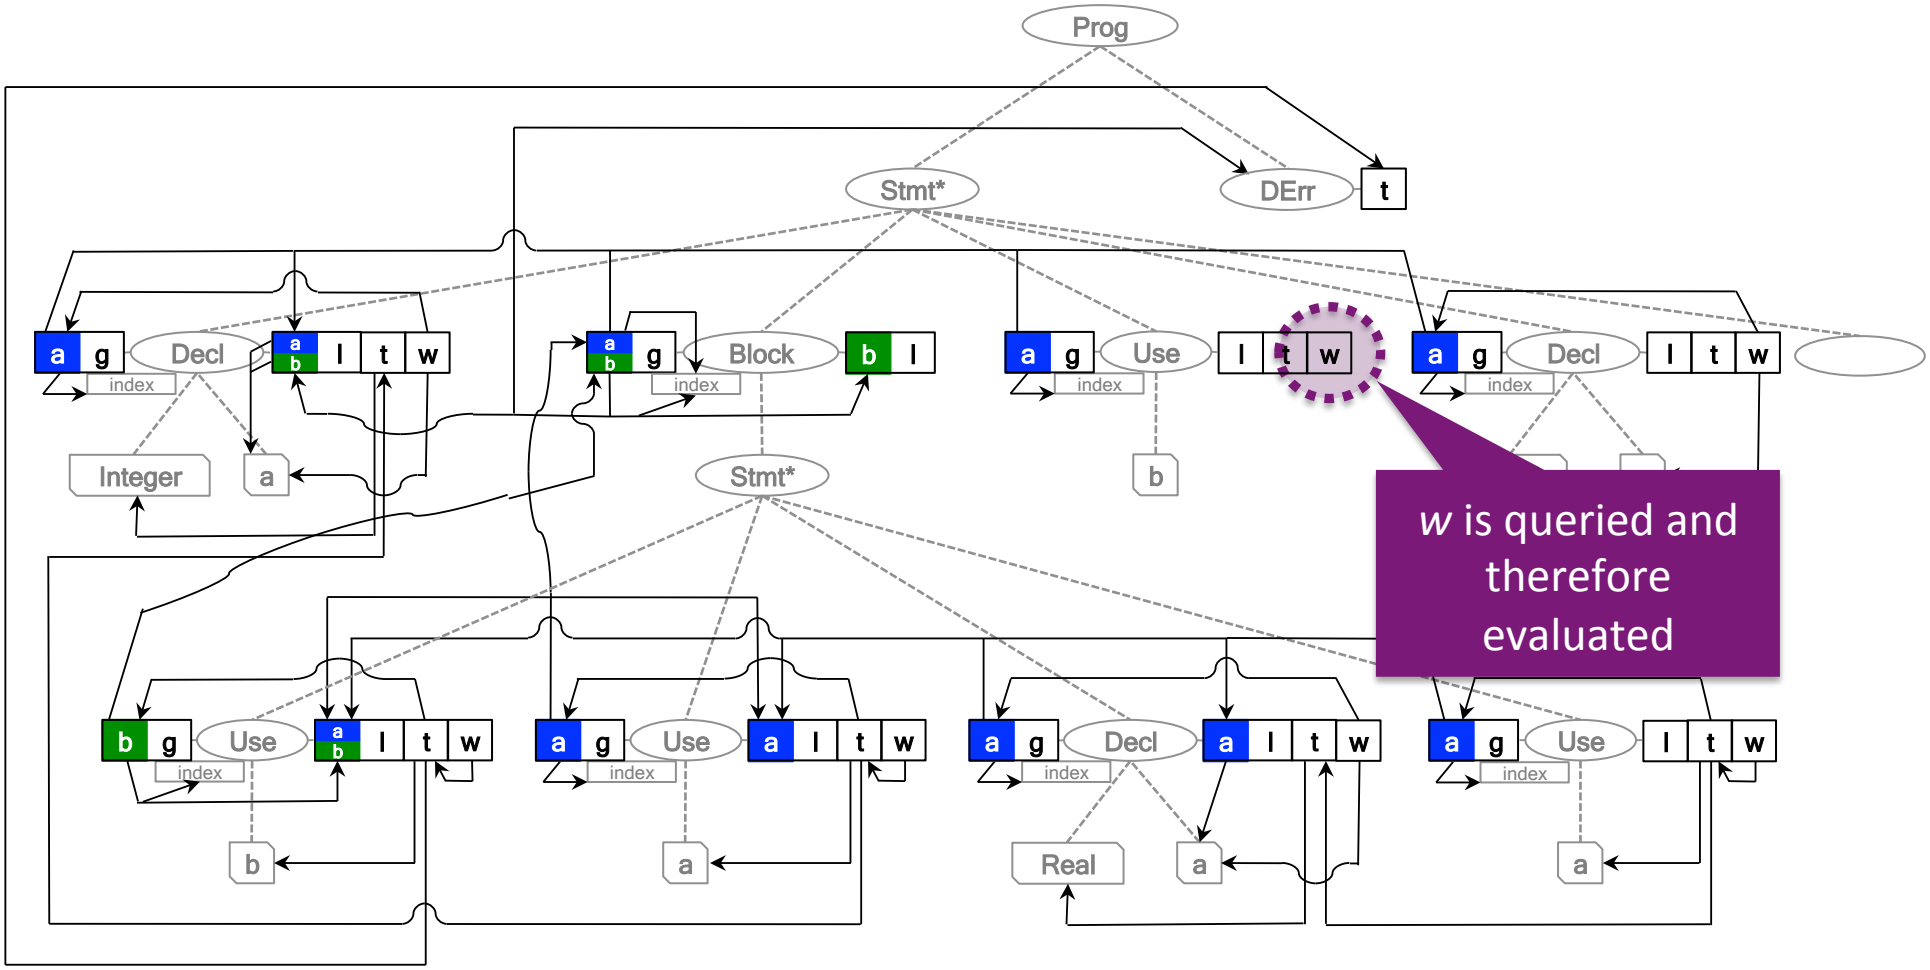
Incremental evaluation



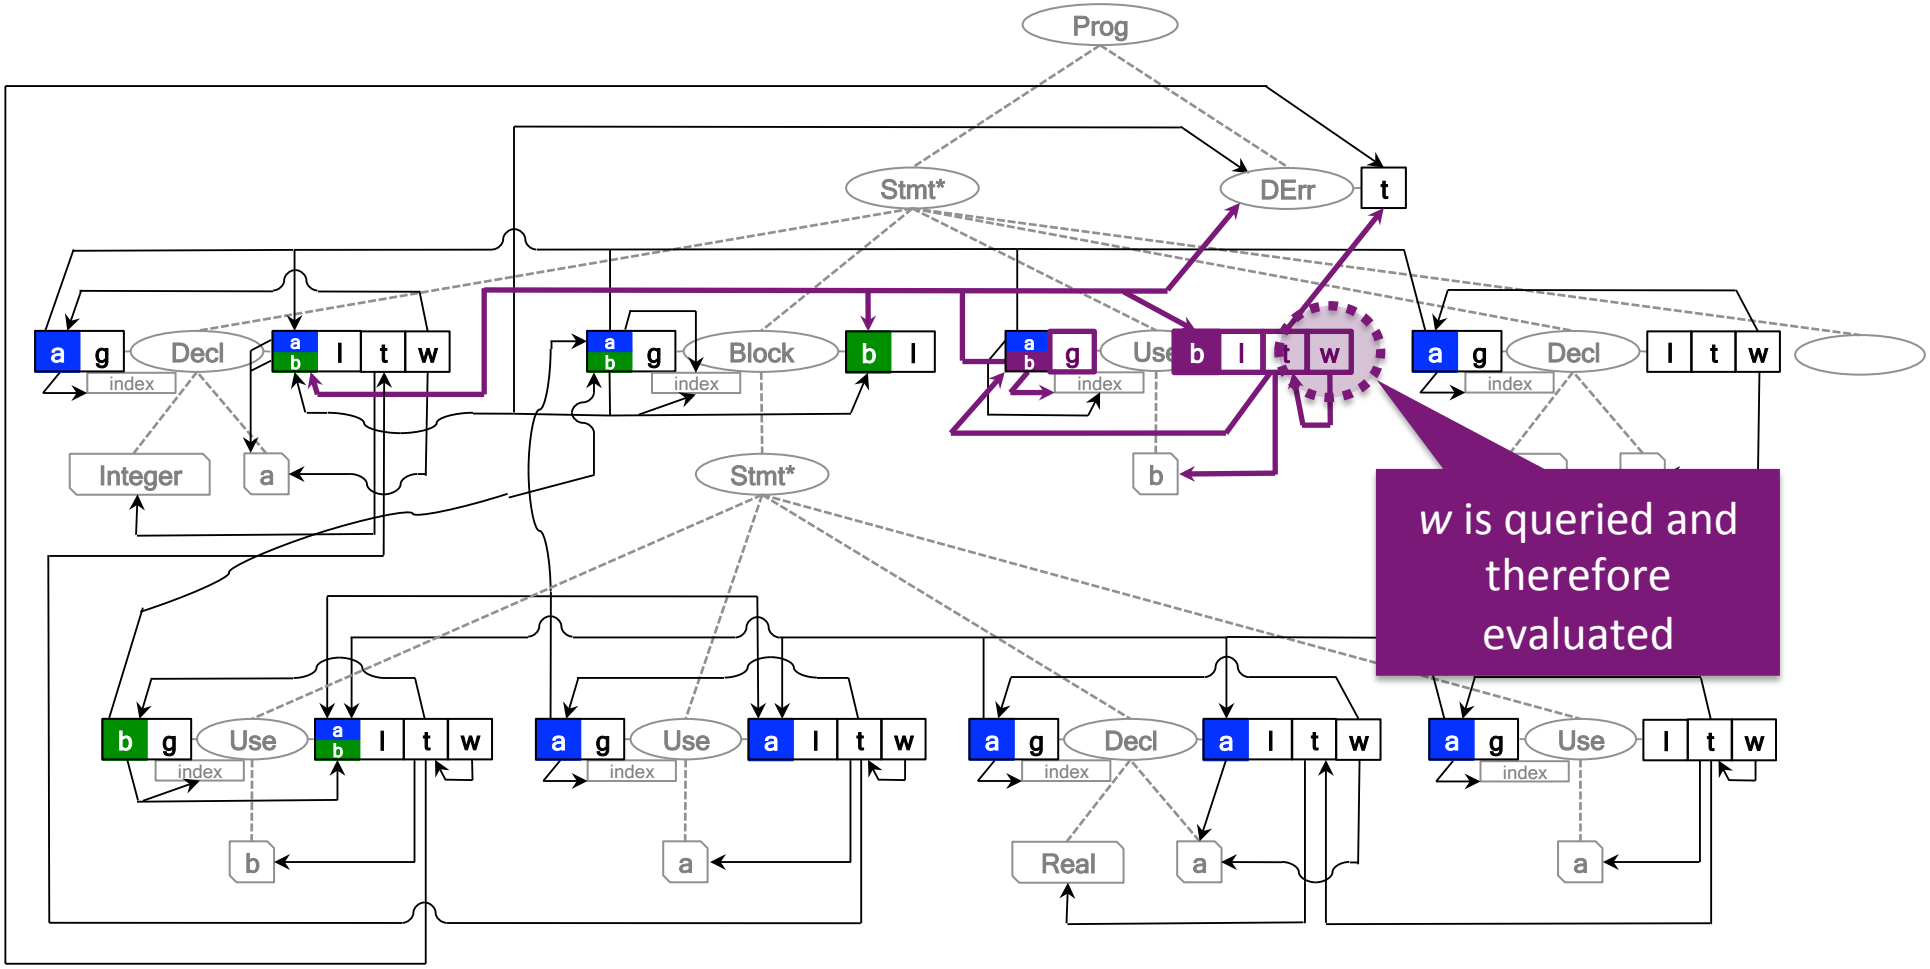
Incremental evaluation



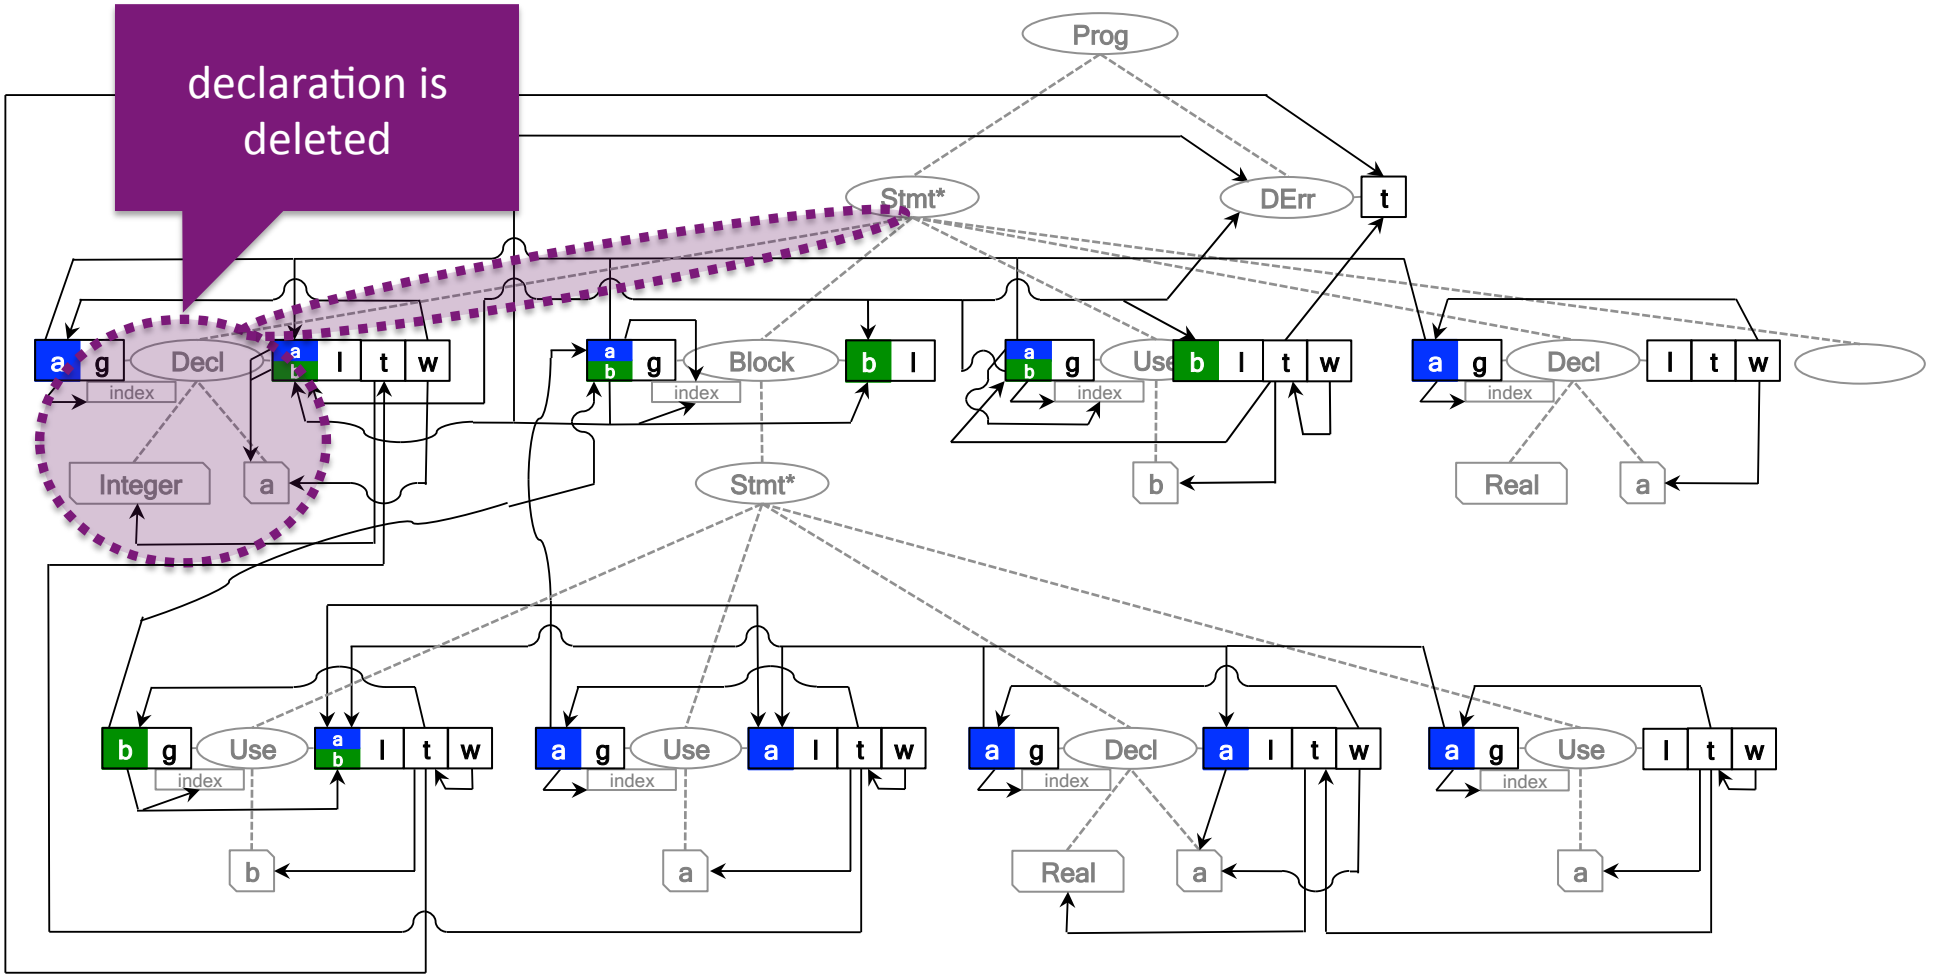
Incremental evaluation



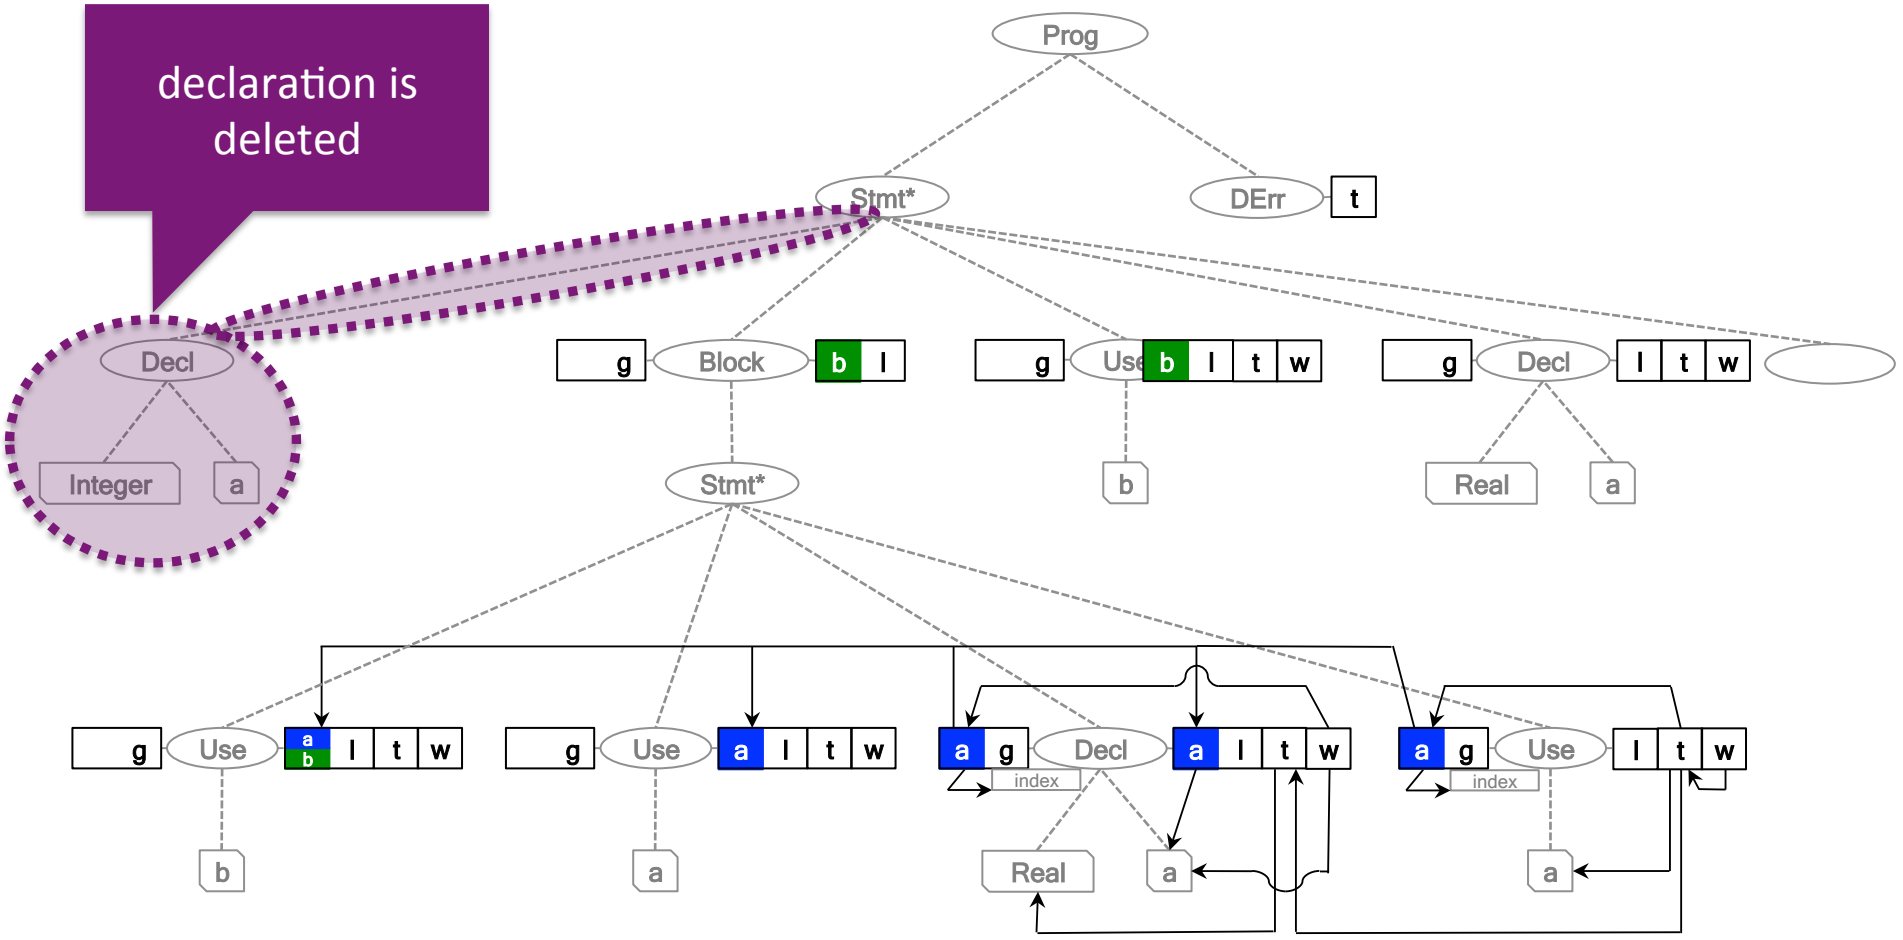
Incremental evaluation



Incremental evaluation



Incremental evaluation



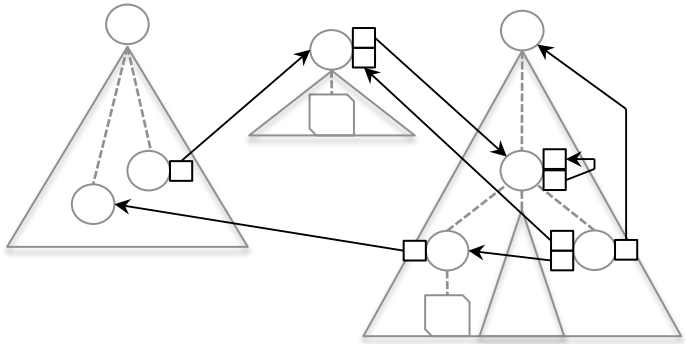
The application
How works RAG-controlled rewriting!

Pattern attributes, transformer attributes & rewrite deduction

Pattern attributes

Attributes can arbitrary query ASGs:

– including structural relations (reference attributes) and constraints (other attributes)



```
(ag-rule my-pattern ; Pattern attribute
 (node-type-to-check-pattern-for
   (lambda (n)
       ; Query ASG and check constraints.
       ; Return nodes relevant for rewriting.
       )))
```

incremental evaluation >>
>> incremental pattern matching

pattern can be deduced using analyses

Transformer attributes

Attribute values can be functions encapsulating deduced transformations.

```
(ag-rule my-transformation ; Transformer attribute
  (node-type-to-derive-transformation-for
    (lambda (n)
      ; Match fragments to transform (e.g., using pattern attributes).
      (and
        match? ; If transformation is not applicable return false, …
        (lambda () ; … otherwise a deduced function encapsulating rewrites.
          ; Apply rewrites on matched fragments.
      )))))
```

incremental

From programmed through RAG-controlled to 'wild' graph rewriting

programmed rewriting via primitive API

```
; Program with arbitrary interleaving of ASG queries & rewrites:
(let ((c (->child n)
      (n (if (=conditional-attribute c)
             (=reference-attribute-1 c) (=reference-attribute-2 c)))
         (r-subtree n some-new-fragment))
```

RAG-controlled rewriting

```
; Interactive use of pattern & transformer attributes:
(let ((trans? (find (lambda (n) (=transformer n)) nodes))
          (and trans? (trans?)))
```

wild rewriting (fixpoint)

```
; Use generic graph rewriter with transformer attributes:
(rewrite-all 'bottom-up list-of-transformer-attributes ASG)
```

all forms supported by *RACR*

The evaluation
What is your proof of concept?

fUML Activity Diagrams[1] of *TTC 2015,*

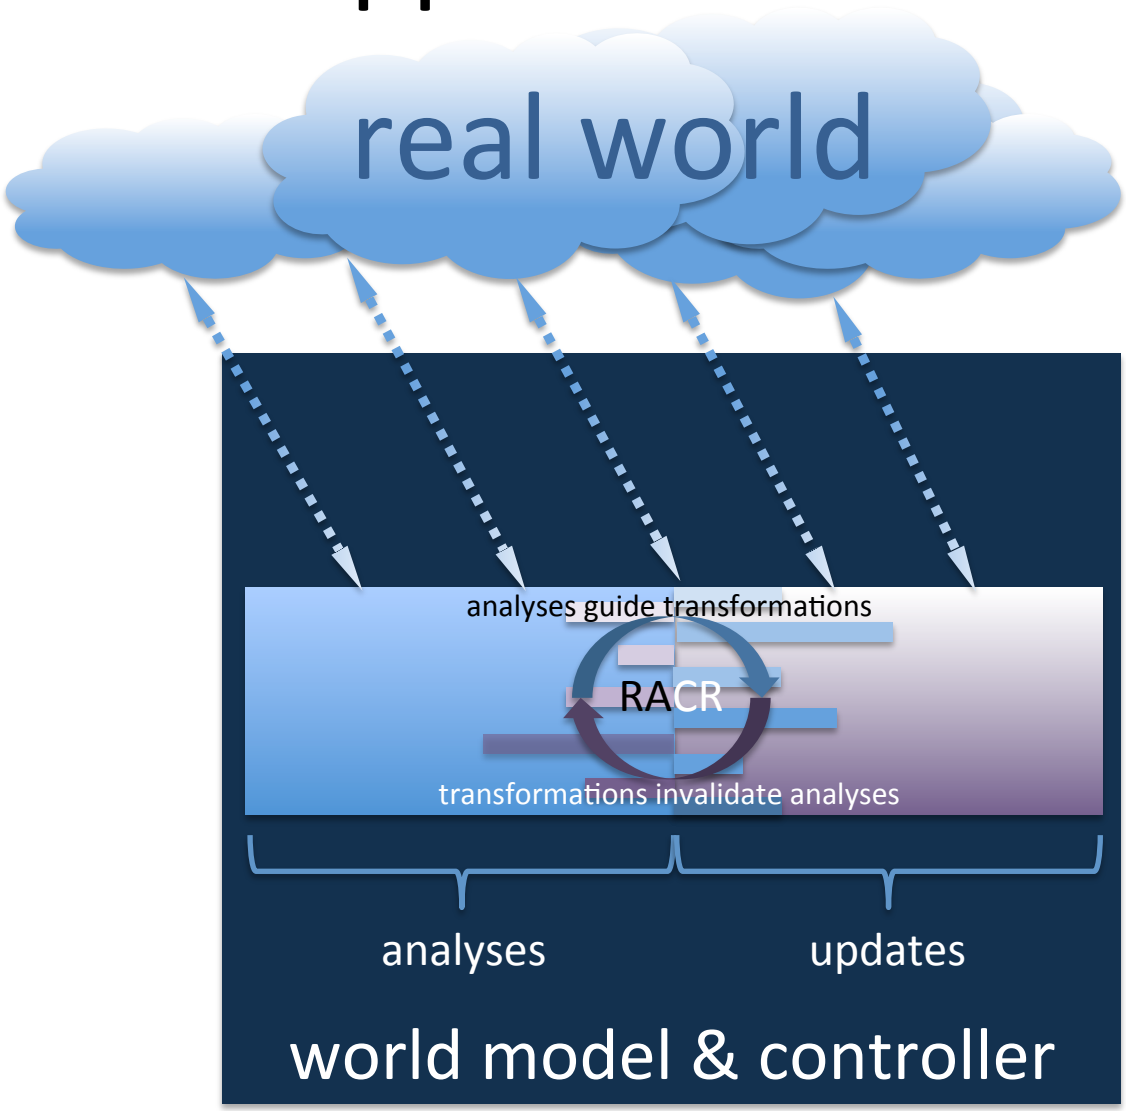
The intention

What are you up to?

RAG-controlled rewriting for incremental runtime models

Intended application: runtime models



limitations of application
open research question

interactive, mutual-dependent analyses & transformations

The conclusion
What was it all about?

RAG-controlled rewriting enables incremental, interactive, mutual-dependent analyses and transformations

What was it all about?

RAG-controlled rewriting

- enables interactive, mutual-dependent ANALYSES and TRANSFORMATIONS
- by seamlessly combining REFERENCE ATTRIBUTE GRAMMARS and GRAPH REWRITING
  - such that ANALYSES CAN GUIDE AND DEDUCE REWRITES
  - and REWRITES UPDATE ANALYSES they influence
- using a well-balanced set of QUERY- and REWRITE-FUNCTIONS
  - constructing a DYNAMIC ATTRIBUTE DEPENDENCY GRAPH
  - that can be used for DYNAMIC ATTRIBUTE INVALIDATION
  - achieving INCREMENTAL ANALYSES AND TRANSFORMATIONS

incremental, interactive, mutual-dependent analyses and transformations
